General Methods.

All chemicals and reagents were purchased from commercial suppliers and used without further purification unless otherwise noted. The following reaction solvents were distilled prior to use: dichloromethane from calcium hydride, diethyl ether and tetrahydrofuran from Na/benzophenone, methanol and ethanol from activated magnesium under argon. All reactions were carried out under an argon atmosphere in either flame or oven-dried (120 °C) glassware. TLC analysis was conducted using glass-backed Thin-Layer Silica Gel Chromatography Plates (60 Å, 250 µm thickness, F-254 indicator). Column chromatography was performed using 230-400 mesh, 60 Å pore diameter silica gel. ¹H and ¹³C NMR spectra were recorded at room temperature on a Bruker AV800, DRX-500 and ARX-400. Chemical shifts (δ values) are reported in parts per million, and are referenced to the deuterated residual solvent peak. NMR data is reported as: δ value (chemical shift, *J*-value (Hz), integration, where s = singlet, d = doublet, t = triplet, q = quartet, brs = broad singlet). Optical rotations were recorded on a Perkin Elmer 341 polarimeter. HRMS and LRMS spectra were recorded at the Purdue University Department of Chemistry Mass Spectrometry Center. HPLC analysis and purification was done on an Agilent 1100 series instrument using a YMC Pack ODS-A column of 4.6 mm ID for analysis and either 10 mm ID or 20 mm ID for purification. The purity of test compounds was determined by HRMS and HPLC analysis. All test compounds showed $\geq 90\%$ purity.

Expression and purification of protease species

Expression and purification of protease were carried out as previously described [1]. Briefly, Rosetta (DE3) pLysS strain (Novagen) was transformed with an expression vector (pET-30a), which contained the genes of wild-type HIV-1^{NL4-3}-PR (PR^{WT}) using heat-shock. The culture was grown in a shake flask containing 30 mL of Luria broth plus kanamycin and chloramphenicol (LB^{Km+/Cp+}) at 37°C overnight. In the expression of PR^{WT}, twenty milliliter of the grown culture was added to 1 L of ZYM-10052 [1.0% N-Z amine, 0.5% yeast extract, 25 mM disodium hydrogenphosphate, 25 mM potassium dihydrogenphosphate, 50 mM ammonium chloride, 5 mM sodium sulfate, 1.0% glycerol, 0.05% glucose, 0.2% α -lactose, 2 mM magnesium sulphate] plus kanamycin and chloramphenicol (ZYM-10052^{Km+/Cp+}). The ZYM-10052^{Km+/Cp+} culture was further continued at 37°C for 20~22 hours. Then the culture was spun down for pellet collection, and thus-obtained pellets were stored at -80 °C until use. For purification of PR^{WT}, the pellet was resuspended in buffer A [20 mM Tris, 1 mM EDTA, and 1 mM DTT] and lysed with sonication. The cell lysates were separated into a supernatant fraction and an inclusion body fraction with centrifugation. PR^{WT} was confirmed to be present in the inclusion body fraction, which was washed five times with buffer A containing 2 M urea and then with buffer A without urea. The twice-washed pellet was solubilized and PRs were unfolded with 100 mM formic acid (pH 2.8). The unfolded PRs were purified using the fast protein liquid chromatography system (ÄKTA pure 25; GE Healthcare) and separated using the reverse phase chromatography column (RESOURS RPC 3 mL; GE Healthcare) using the gradient of buffer B [1.0% formic acid, 2.0% acetonitrile] and buffer C [1% formic acid, 70% acetonitrile]. The flow rate was set to 1.0 mL min⁻¹ and the column was equilibrated with 75% buffer B and 25% buffer C. Then, the amount of buffer C was increased to 75% over a 30 min period (10-time the column volume). PR^{WT} was eluted with 35~50% buffer C. After the elution, buffer C amount was increased to 100% in 6 min and returned to the starting condition over the next 6 min. The peak fractions including PR^{WT} were collected and three-time diluted with buffer B. The diluted PR^{WT} solution was injected into the ÄKTA pure 25 again and the targeted PR^{WT} was purified using the same purification step as described above. The collected fractions containing PR^{WT} were subjected to desalting (HiTrap Desalting; GE Healthcare) and the eluted solution was equilibrated using 100 mM formic acid and stored at -80 °C until use.

The unfolded PR^{WT} was refolded with the addition of a neutralizing buffer A [100 mM ammonium acetate pH 6.0, 0.005% Tween-20], making the final pH 5.0 to 5.2. The PR^{WT}-containing solution was run through Amicon Ultra-15 10K centrifugal filter units (Millipore), giving a solution containing PR (5~8 mg/ml) in 10 mM ammonium acetate pH 5.0 and 0.005% Tween-20. Occasionally, twice greater concentrations of a test compound were used for crystallization. After centrifugation, the supernatants were collected and subjected to crystallization using the hanging-drop vapor diffusion method. Nextal Tubes ProComplex Suite (QIAGEN) and Wizard Crystallization Screen Series (Emerald BioSystems) were used for the first screening to determine the optimum crystallization condition.

Table S1: Crystallographic Data Collection and Refinement Statistics

	PR/compound 4I (GRL-072-17A)
Space group	P2 ₁ 2 ₁ 2
Unit cell dimensions: (Å)	
a	58.57
b	85.88
c	46.31
Resolution range (Å)	50-1.32 (1.37-1.32)
Redundancy (final shell)	5.8 (4.8)
Unique reflections	51438 (3856)
Completeness (%) overall (final shell)	93.6 (71.5)
R _{merge} (%) overall (final shell)	8.9 (51.2)
I/σ(I) overall (final shell)	17.1 (3.9)
Refinement	
R (%)	13.2
R _{free} (%)	16.4
No. of solvent atoms	232
RMS deviation from ideality	
Bonds (Å)	0.019
Angle (degree)	2.2
Average B-factors (Å ²)	
Whole chain atoms	16.4
Inhibitor	13.5
Solvent	25.4

Figure S1: 2Fo-Fc electron density map showing two alternative conformations of inhibitor 4I. The 2Fo-Fc electron density map (gray) for inhibitor **4I** in the X-ray structure with HIV protease is contoured at a level of 1 sigma. The carbon atoms are shown in green for conformation A and in yellow for conformation B of inhibitor with relative occupancies of 0.55 and 0.45.

Geometric Criteria for Weak Interactions.

Hydrogen bond interactions are defined by standard geometrical criteria as described in [1, 2]. The geometric criteria for weak interactions are: C-H...O (distance between C and O ≤ 3.5 Å, angle $\geq 90^\circ$), O-H... π (distance ≤ 4.3 Å to centroid of π system, angle $\geq 120^\circ$), C-H... π (distance ≤ 4.5 Å, angle $\geq 120^\circ$) [1-3], lone pair (n)- π as C=O... π (distance is between 2.8 to 3.8 Å to center of π system, angle between two planes $\leq 90^\circ$) [4] and π - π stacking [5].

HIV-1 Protease inhibitory assay. The assay is based upon reported procedure (1). Fluorescence measurements were made using PerkinElmer LS-50B Luminescence Spectrophotometer. Ten microliters of a stock solution (0.05 mg/mL) of HIV protease were incubated with five different concentrations of substrate 2-(aminobenzoyl)-Thr-Ile-Nle-Phe(p-NO₂)-Gln-ArgNH₂ (K_m = 37 at 37 °C with the increase in fluorescence monitored. A stock solution of 1 mM substrate in DMSO was diluted to 0.1 mM with assay buffer and used for the assay. All k_{cat} and K_m values were obtained employing standard data fitting techniques for a reaction obeying Michaelis-Menten kinetics. The data curves were fitted using SigmaPlot. The active enzyme concentrations were calculated from the intercept of the linear fit to the IC₅₀ versus [S] plots with the IC₅₀ axis. The K_i values were obtained from the IC₅₀ values estimated from an inhibitor dose-response curve with the spectroscopic assay using the equation $K_i = (IC_{50} - [E]/2)/(1 + [S]/K_m)$, where [E] and [S] are the PR and substrate concentrations, respectively. The K_i values were measured at four to five substrate concentrations. The measurements were repeated at least three times to produce the average values given in Table 3.

Cells, viruses, and antiviral agents. The MT-2 cells were obtained from the NIH AIDS Reagent Program, NIAID, NIH, Bethesda, MD, USA (2). Human CD4⁺ MT-2 cells were grown in RPMI-1640-based culture medium supplemented with 10% fetal calf serum (FCS: JRH Biosciences, Lenexa, MD), 50 unit/mL penicillin, and 100 µg/mL of kanamycin (3,4). Darunavir (DRV) was synthesized as previously described (5).

Acq. Operator : SYSTEM
Sample Operator : SYSTEM
Acq. Instrument : LC2 Location : 1
Injection Date : 6/11/2024 12:20:39 PM
Inj Volume : 5.000 µl
Acq. Method : C:\Chem32\1\Methods\AB-02-34A.M
Last changed : 6/11/2024 12:19:49 PM by SYSTEM
(modified after loading)
Analysis Method : C:\Chem32\1\Methods\AB-02-34A.M
Last changed : 6/11/2024 2:41:19 PM by SYSTEM
(modified after loading)
Method Info : Pump leak test method
Sample Info : 50% MeCN/H2O
1.0 mL/min
254 nm
5 uL inj.
1.0 mL/min
ymcpak-odsa

Concentration = 0.8 mg/mL of compound in
ACN : H₂O (1 : 1)

Additional Info : Peak(s) manually integrated
VWD1 A, Wavelength=254 nm (ASH-OBC-4K-254-12 539.D)
