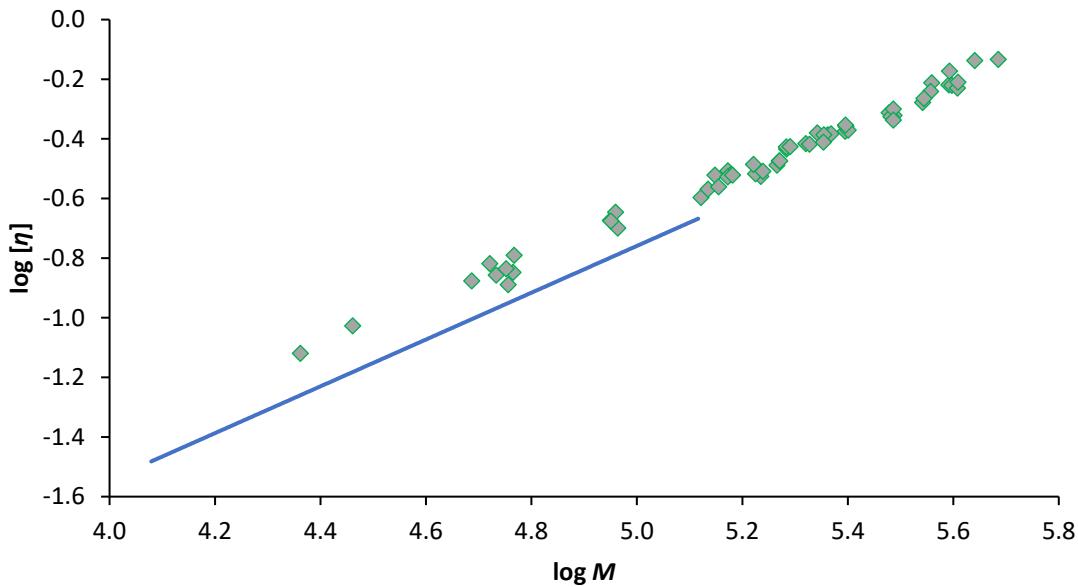

Figure S1: A comparison of the MHKS relationship between PDMAEMA intrinsic viscosity and polymer molar mass in THF estimated in this work (Waters-Wyatt setup (blue line)) to values reported by Kockler et al.¹ (green diamonds). Kockler et al. used their MHKS values for PDMAEMA in combination with PMMA calibration, whereas in this study PS calibration was employed.

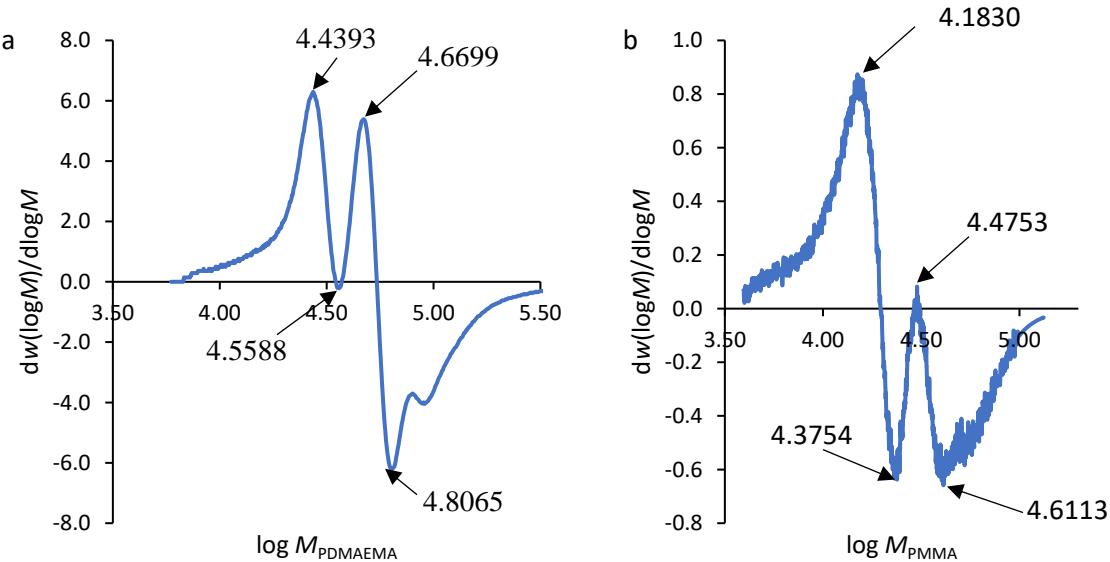

Figure S2: A comparison of PDMAEMA first derivative curves determined by differentiation of the polymer MMDs analyzed by: (a) SEC-RI in THF according to PDMAEMA calibration and (b) SEC-RI in DMF (1 mmol L⁻¹ LiBr) using pMMA calibration. The polymer was generated by PLP by pulsing bulk monomer at 90 °C with a p.r.r. of 100 Hz.

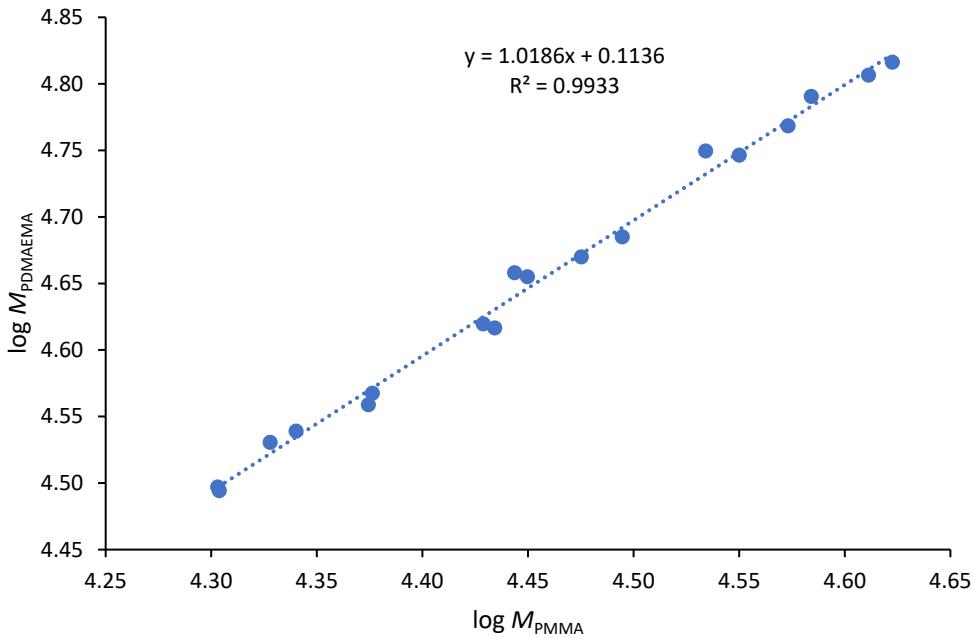

Figure S3: Log M_{PDMAEMA} vs log M_{PMMA} values obtained from analysis of PDMAEMA MMDs by RI detection in THF (calculated according to universal calibration) and RI detection in DMF (1 mmol L⁻¹ LiBr) according to PMMA calibration, respectively. The fit was used to estimate MHKS parameters of PDMAEMA in DMF as $K = 6.99 \times 10^{-5}$ dL g⁻¹ and $\alpha = 0.663$ from the slope and intercept according to Eq. 2 of the article.

Table S1: Mark-Houwink-Kuhn-Sakurada (MHKS) parameters for PDMAEMA and calibration polymers PS and PMMA analyzed by organic-phase SEC

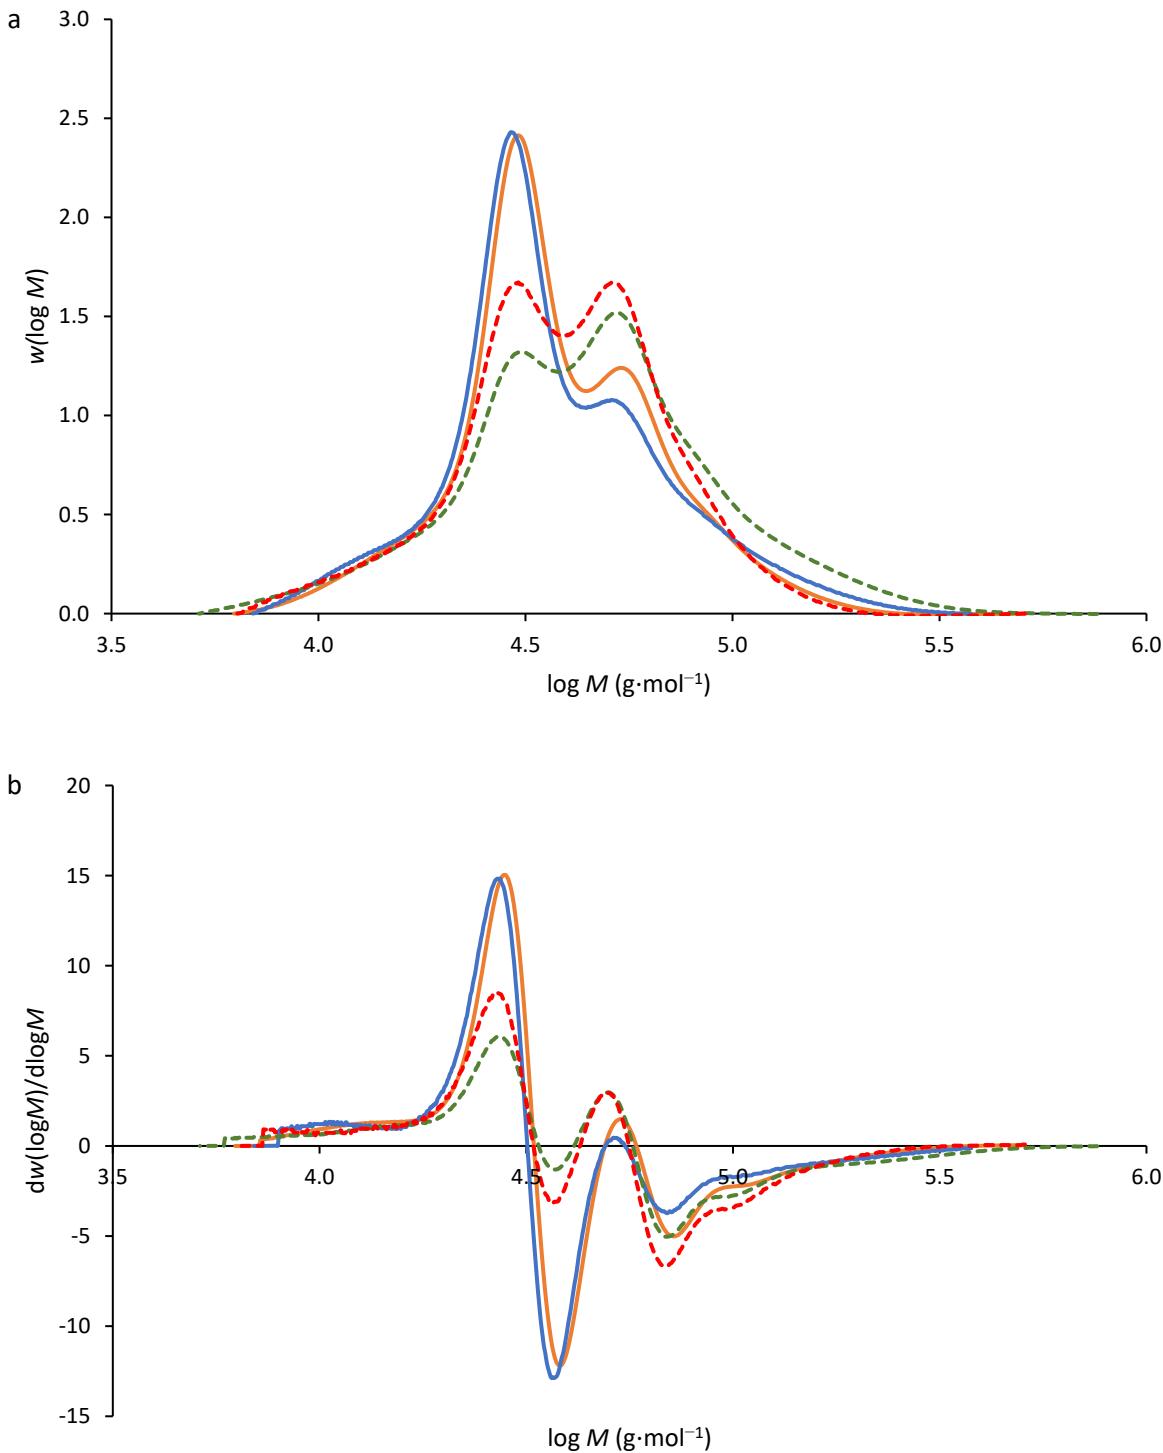

Figure S4: PLP-generated PDMAEMA a) MMDs and b) first derivative plots from SEC analysis in THF of bulk DMAEMA at 30 °C and 20 Hz with 5 mmol L⁻¹ DMPA (solid lines) and 5 mmol L⁻¹ Darocur 1173 (dashed lines), with two repeated polymerization experiments shown for each photoinitiator. The inflection point positions were the same for both initiators, with improved PLP structure obtained using DMPA.

Table S5(b): Propagation rate coefficients for polymerization of DMAEMA in EtOH/H₂O solutions determined from PLP-SEC experiments conducted at 40 °C at varying laser pulse repetition rates (p.r.r.) tabulated as a function of weight fraction DMAEMA (w_{DMAEMA}) in solution. Experiments were conducted with 5 mM Darocur 1173.
