Scheme S1. Three-component system for the photopolymerization of an acrylate monomer with Ni^{II} complexes bearing Schiff base ligands as photocatalysts.¹

Analyses

The ¹H NMR spectra were acquired in CD₃OD at 298 K on an Agilent MR 400 Ultrashield spectrometer operating at 400 MHz. Chemical shifts were reported in ppm relative to the high frequency of TMS. Infrared spectra were obtained on a Perkin Elmer Frontier instrument equipped with a diamond ATR module, collected between 4000 and 250 cm⁻¹ at a scan rate of one spectrum every 64 s with a 2 cm⁻¹ resolution at 298 K. The mass analyses have been made on a Q-TOF mass spectrometer Impact II Bruker equipped with a ESI source used in positive mode. Source parameters are settled as follow: capillary voltage at 4.5kV, nebulizer pressure at 5.8 psi (ie 0.4 bar), dry gas flow at 4.0L/min. and dry temperature at 180°C. The TOF was calibrated just before analysis using a formates sodium adducts mixture in ultra-pure water infused directly into the source in the same conditions. The sample was diluted in CH₃CN in order to reach a concentration of about 1-10ng/µL and was directly infused into the source. MALDI-

TOF analyses were performed on a Bruker Daltonics Autoflex III Smartbeam. Electronic spectra were recorded on a Shimadzu model UV-1800 spectrophotometer using 1 cm path length quartz cells. Solutions of the complexes and ligands in CH_2Cl_2 at a concentration of 2×10^{-4} mol L⁻¹ were used for these measurements. Elemental analyses were conducted using a Perkin-Elmer CHN 2400 instrument.

1. ¹H NMR characterization of NHC ligands

HC1: Yield: 75%. ¹H NMR (400 MHz, CDCl_3 , ppm, 25 °C): $\delta = 11.29$ (t, $^4J_{\text{H,H}} = 1.57$ Hz, 1H, NCHN), 9.15 (d, $^3J_{\text{H,H}} = 8.31$ Hz, 1H, Ar-py), 8.80 (t, $^3J_{\text{H,H}} = 1.80$ Hz, 1H, ImH), 8.53-8.48 (m, 1H, Ar-py), 8.07 (dt, $^4J_{\text{H,H}} = 1.81$ Hz, $^3J_{\text{H,H}} = 8.04$ Hz, 1H, Ar-py), 7.49-7.45 (m, 1H, Ar-py), 7.38 (t, $^3J_{\text{H,H}} = 1.60$ Hz, 1H, ImH), 7.02 (s, 2H, Ar-mes), 2.32 (s, 3H, CH_3 -Ar-mes), 2.16 (s, 6H, CH_3 -Ar-mes).

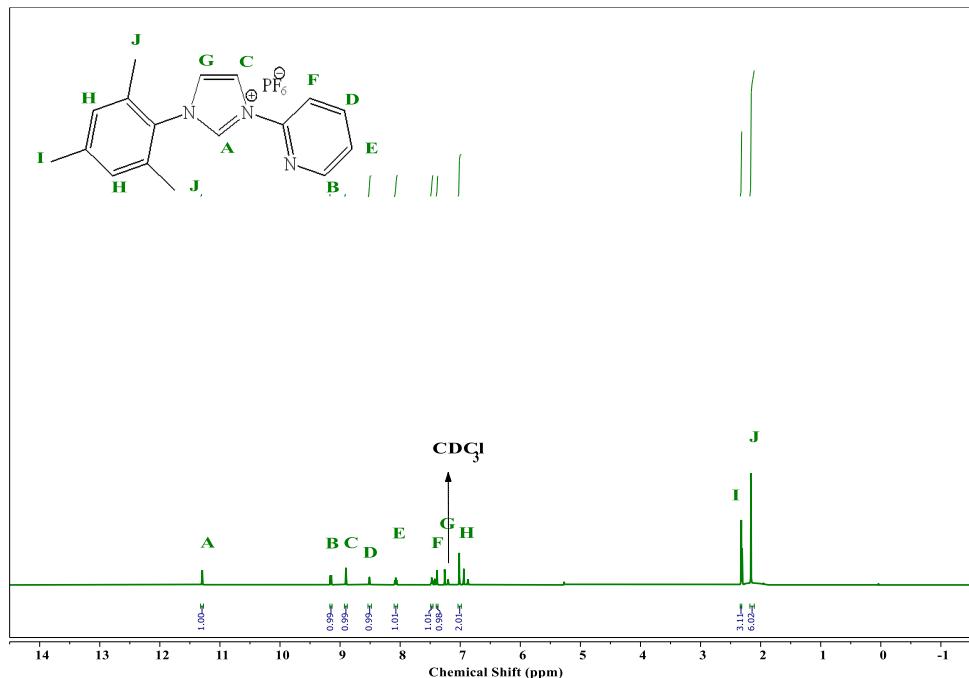

Figure S1. ¹H NMR spectrum for HC1 in CDCl_3 .

HC2: Yield: 75%. ^1H NMR (400 MHz, DMSO-d6, ppm, 25 °C): δ = 10.04 (t, $^4J_{\text{H,H}} = 1.50$ Hz, 1H, NCHN), 8.65 (t, $^3J_{\text{H,H}} = 1.74$ Hz, 1H, ImH), 8.20 (t, $^3J_{\text{H,H}} = 1.70$ Hz, 1H, ImH), 7.95-7.89 (m,c 2H, *o*-ph), 7.75-7.59 (m, 3H, *m*- and *p*-ph), 2.35 (s, 3H, CH₃-Ar-mes), 2.12 (s, 6H, CH₃-Ar-mes).

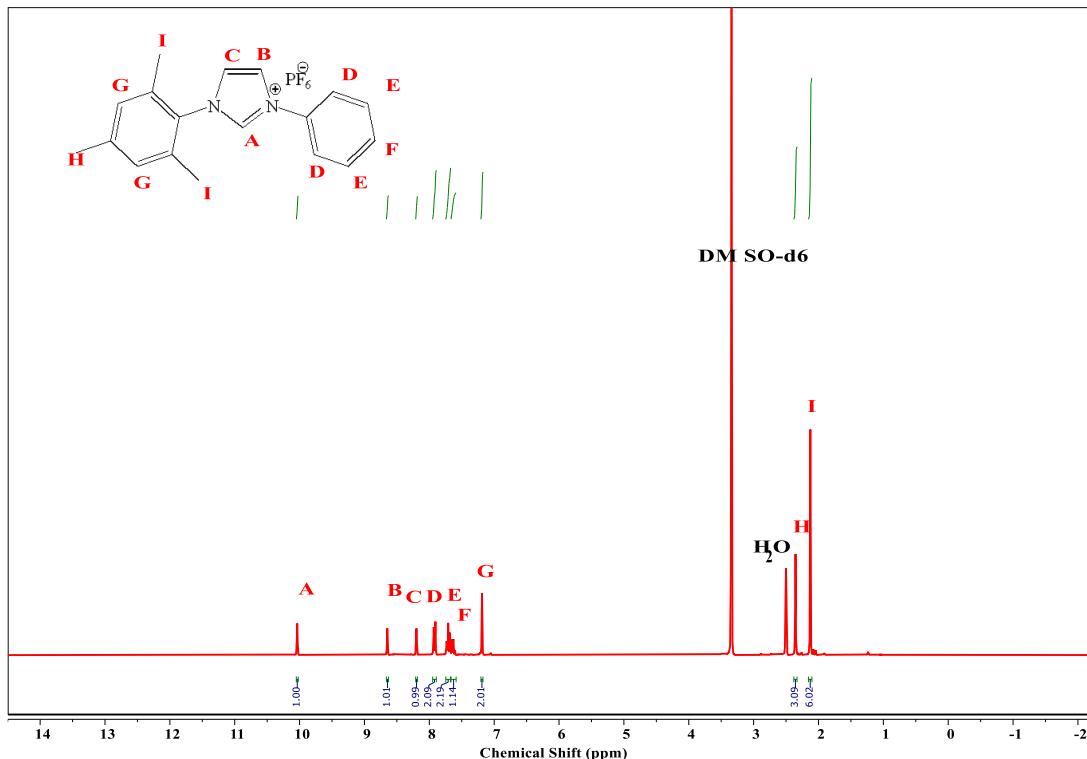

Figure S2. ^1H NMR spectrum for HC2 in DMSO-d6.

2. ^1H NMR characterization of Ni^{II} complexes

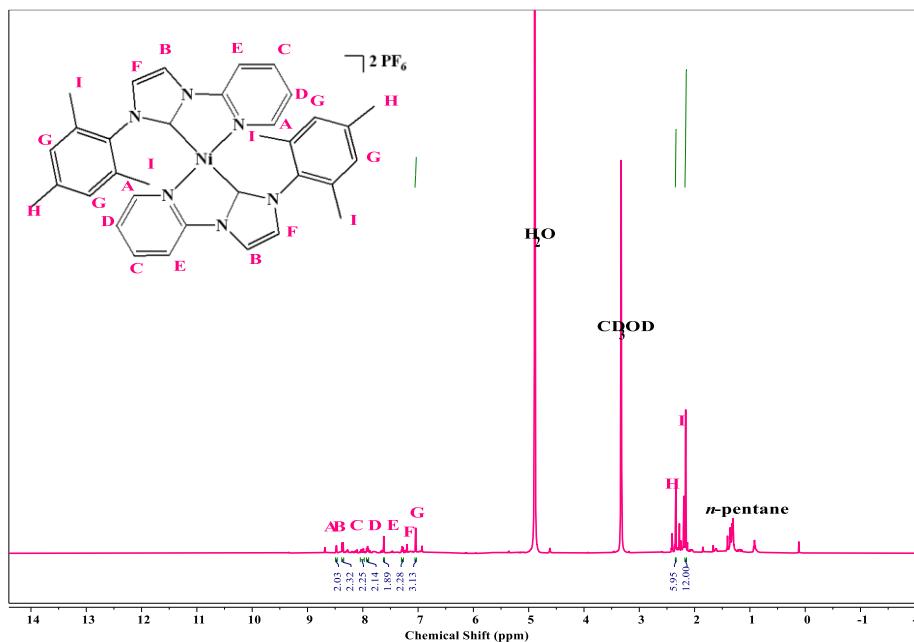

Figure S3. ^1H NMR spectrum for NiC1 in CD_3OD .

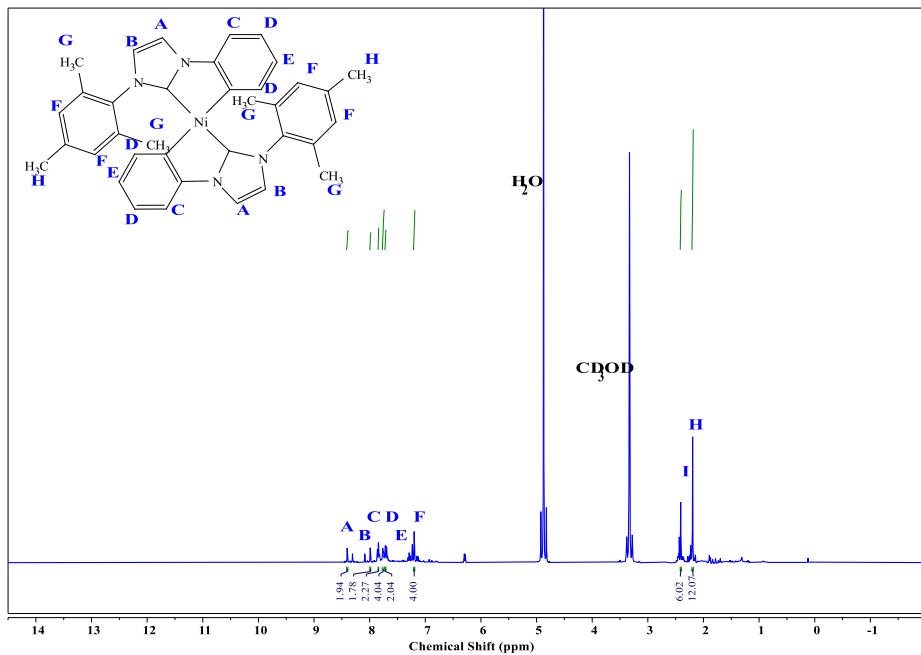

Figure S4. ^1H NMR spectrum for NiC2 in CD_3OD .

3. FTIR characterization of NHC ligands and Ni^{II} complexes

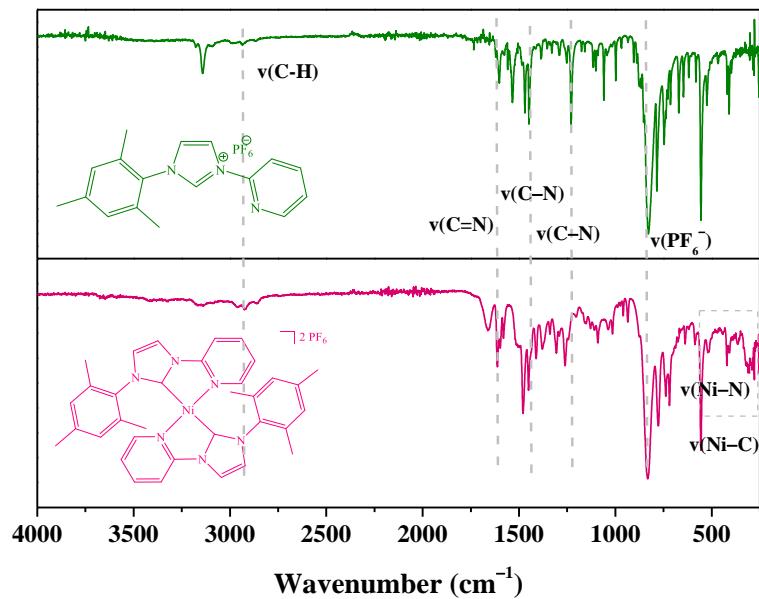

Figure S5. FTIR spectra for **NiC1** (pink line) and **HC1** (green line).

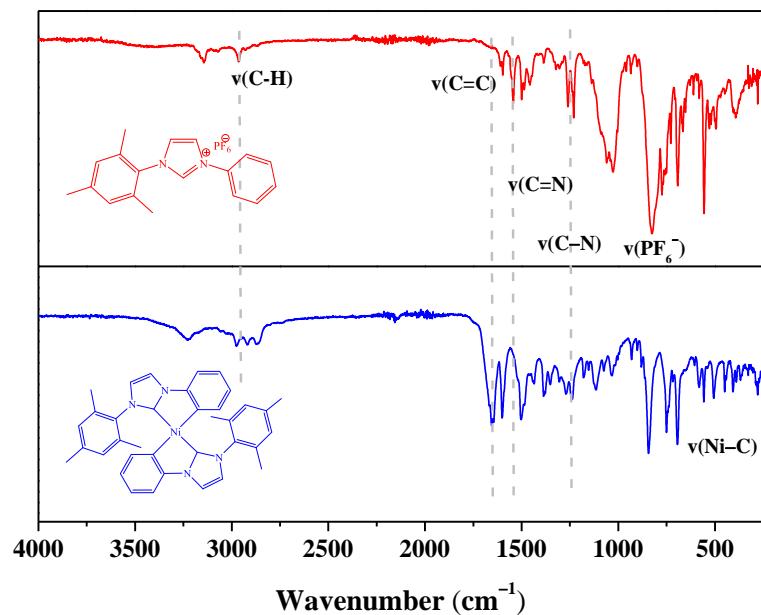

Figure S6. FTIR spectra for **NiC2** (blue line) and **HC2** (red line).

4. Experimental ESI-MS characterization of NiC1

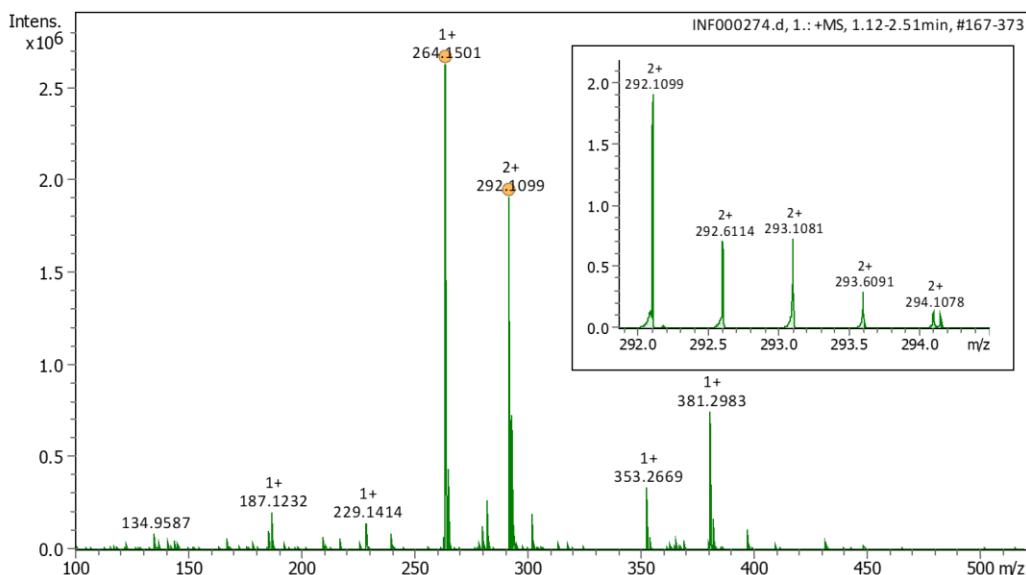

Figure S7. Experimental ESI-MS of NiC1 in positive mode (calcd: $m/z^{2+} = 292.1100$; $[M-2PF_6^-]^{2+}$).

5. MALDI-TOF mass characterization of Ni^{II} complexes

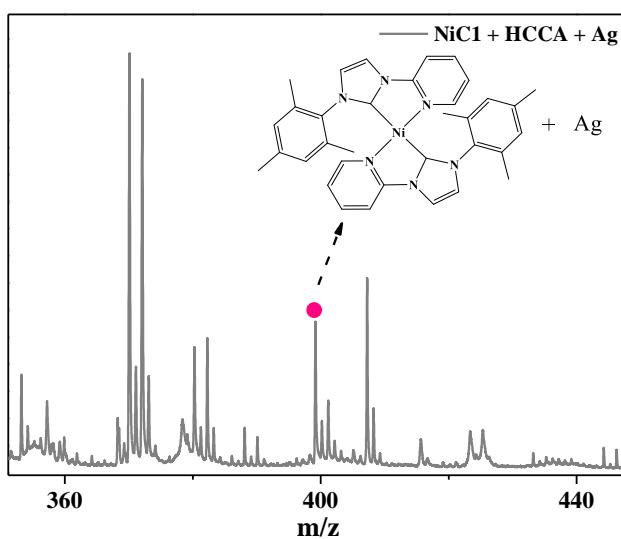

Figure S8. MALDI-TOF mass spectrum of complex NiC1.

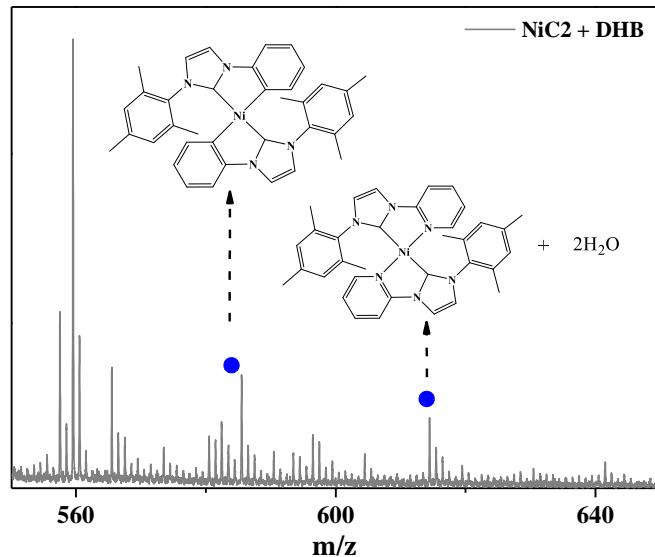

Figure S9. MALDI-TOF mass spectrum of complex **NiC2**.

6. UV-Vis characterization of Schiff-base ligands and Ni^{II} complexes

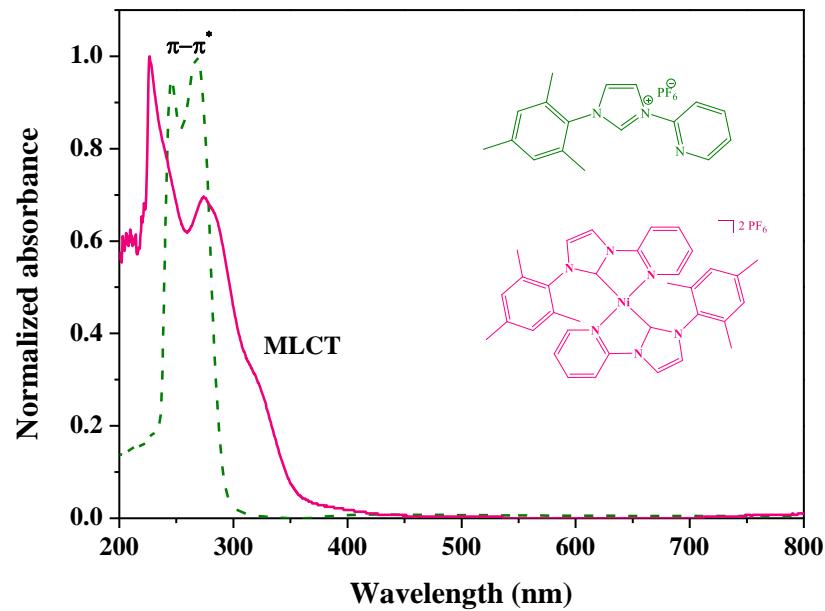

Figure S10. UV-Vis spectra for **NiC1** (solid pink line) and **HC1** (dash green line).

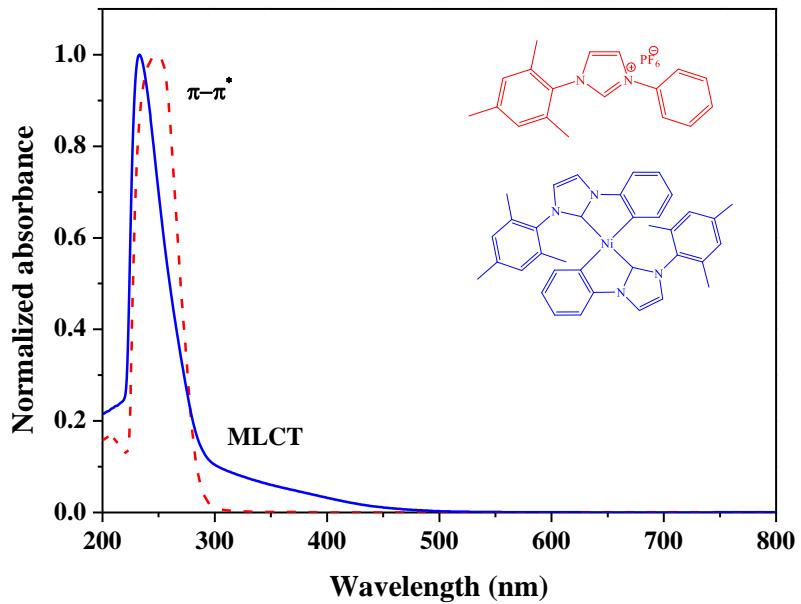

Figure S11. UV-Vis spectra for **NiC2** (solid blue line) and **HC2** (dash red line).

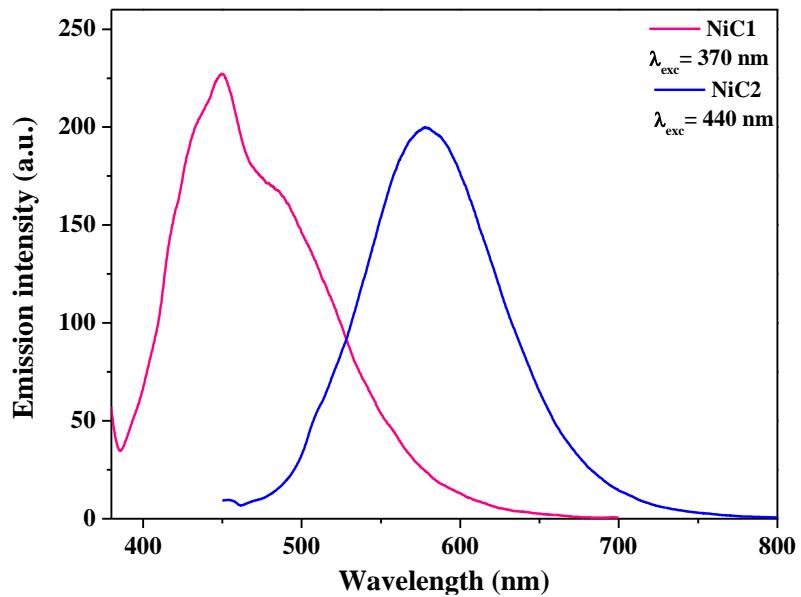

Figure S12. Emission spectra for **NiC1** (solid pink line) and **NiC2** (solid blue line).

7. Cyclic voltammetry of Ni^{II} complexes

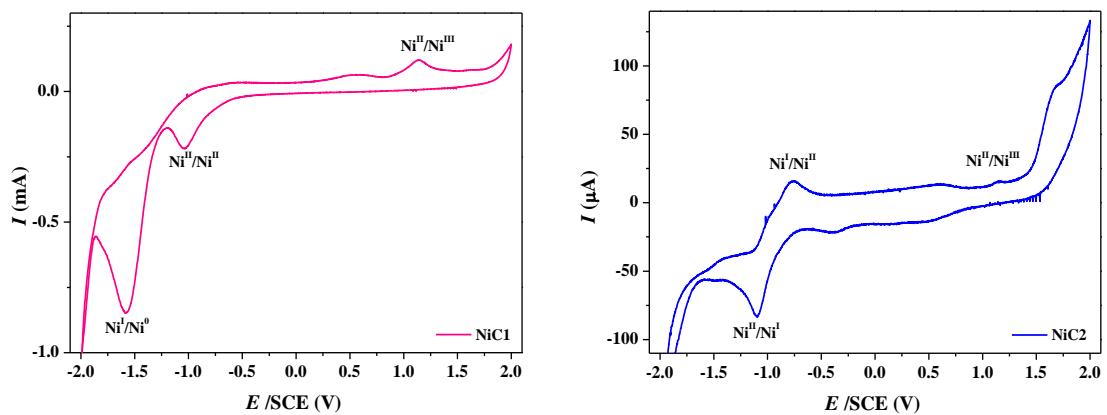

Figure S13. Cyclic voltammetry of **NiC1**, and **NiC2** from 1×10^{-3} mol L⁻¹ in acetonitrile solutions and $n\text{-Bu}_4\text{NPF}_6$ 0.1 mol·L⁻¹ vs. SCE; obtained at 100 mV·s⁻¹ at 25 °C.

8. Steady-state photolysis of the Ni^{II} complexes

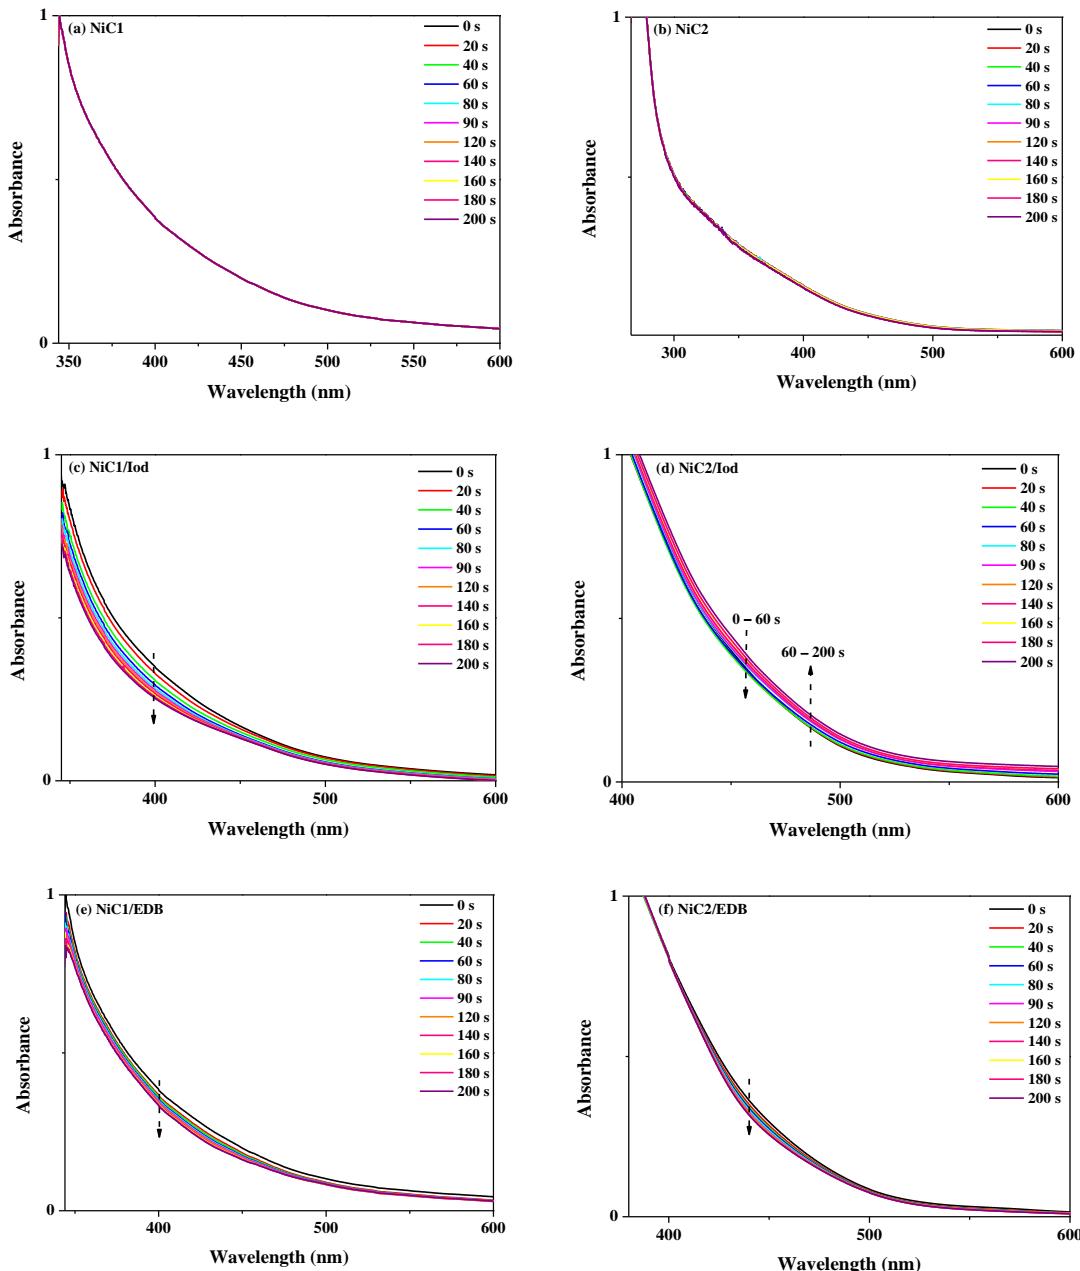

Figure S14. UV–Vis absorption spectra of **NiC1** and **NiC2** in CH_2Cl_2 : (a,b) Ni^{II} , (c,d) $\text{Ni}^{\text{II}}/\text{Iod}$, and (d,e) $\text{Ni}^{\text{II}}/\text{EDB}$ upon exposure under air to LED@405 nm for different times.

9. Fluorescence quenching of NiC1

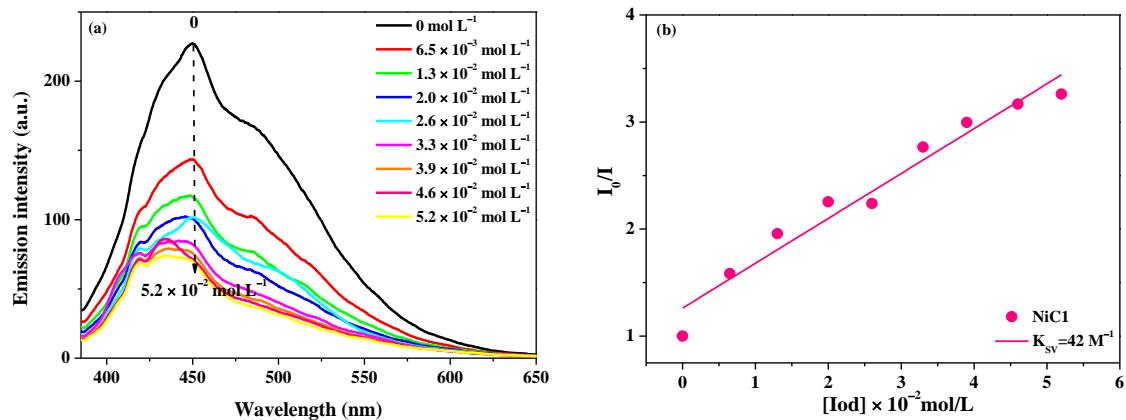

Figure S15. Fluorescence quenching of **NiC1** with additives in CH_2Cl_2 : (a) **NiC1**/Iod; (b) Stern-Volmer coefficient determination with Iod.

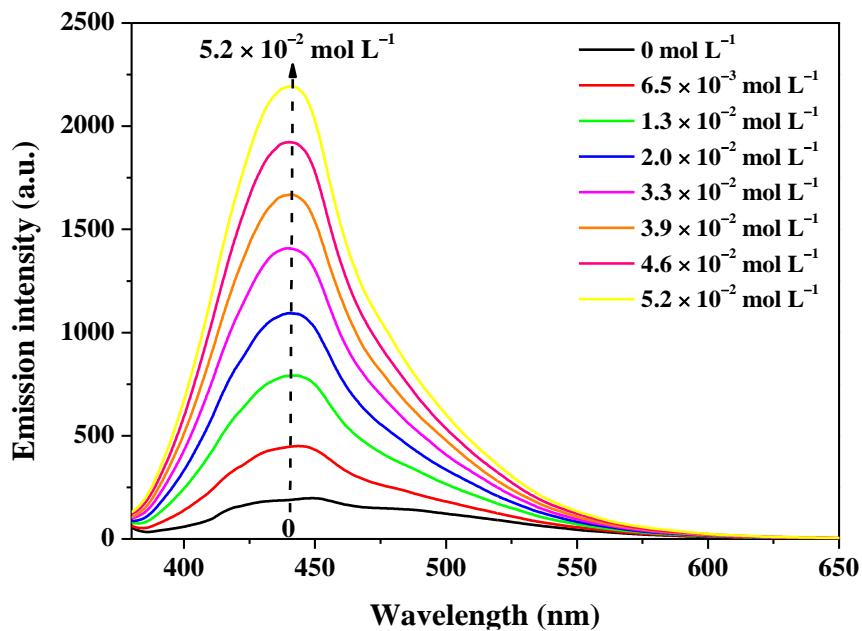

Figure S16. Emission spectra of **NiC1** with EDB in CH_2Cl_2 .

10. FTIR spectra of photopolymerizations

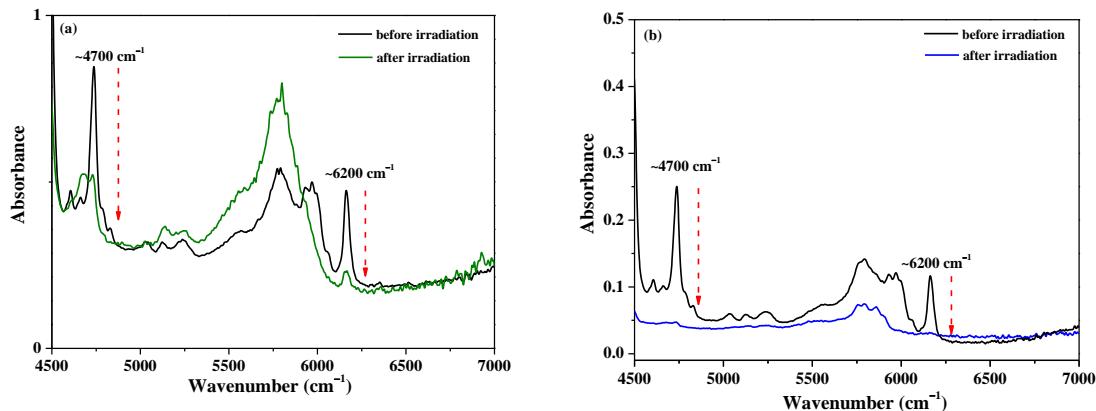

Figure S17. FTIR spectra recorded before and after photopolymerization for 0.2%/2%/2% w/w/w NiC2/Iod/EDB under LED@405 nm. (a) under pallet; (b) in laminate.

11. ESR spin-trapping experiments of NiC1

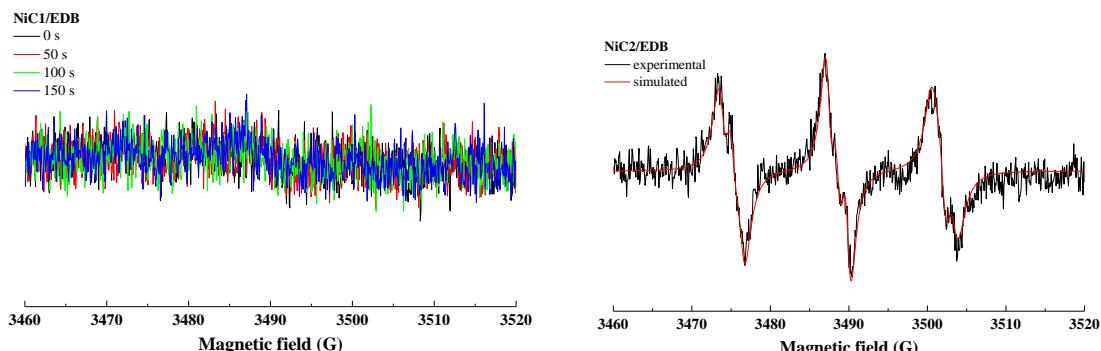

Figure S18. ESR spectra obtained from ESR-spin trapping experiments under LED@405 nm using $\text{PBN} = 5 \times 10^{-2} \text{ mol L}^{-1}$ (as the spin trap agent); $\text{EDB} = 1 \times 10^{-2} \text{ mol L}^{-1}$, and $\text{Ni}^{\text{II}} = 1 \times 10^{-3} \text{ mol L}^{-1}$ in CH_2Cl_2 .
