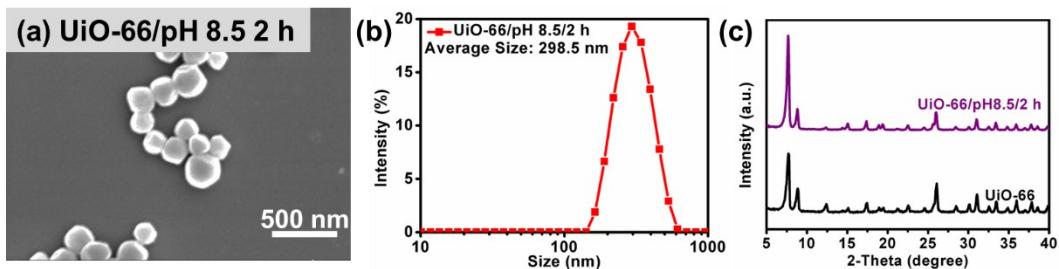

Fig. S1. (a) SEM image and (b) DLS measurement image, and (c) XRD of UiO-66 particles after being immersed in Tris-HCl buffer (pH=8.5) for 2 h.

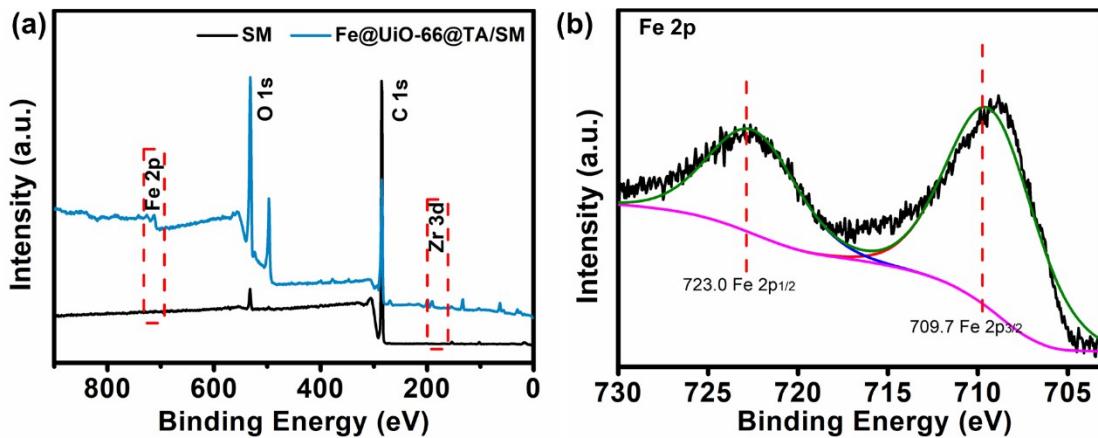

Fig. S2. XPS spectra of SM and Fe@UiO-66@TA/SM: (a) survey spectrum and (b) Fe 2p core-level spectrum of Fe@UiO-66@TA.

Compared to the pristine SM, the Fe@UiO-66@TA/SM exhibited a new peak at 187.7 eV, corresponding to Zr 3d (**Fig. S2a**).¹ Moreover, the Fe 2p_{3/2} signal showed a main peak at ~709.7 eV with a 2p peak separation of ~12–14 eV, consistent with the presence of Fe(III) species (**Fig. S2b**).²

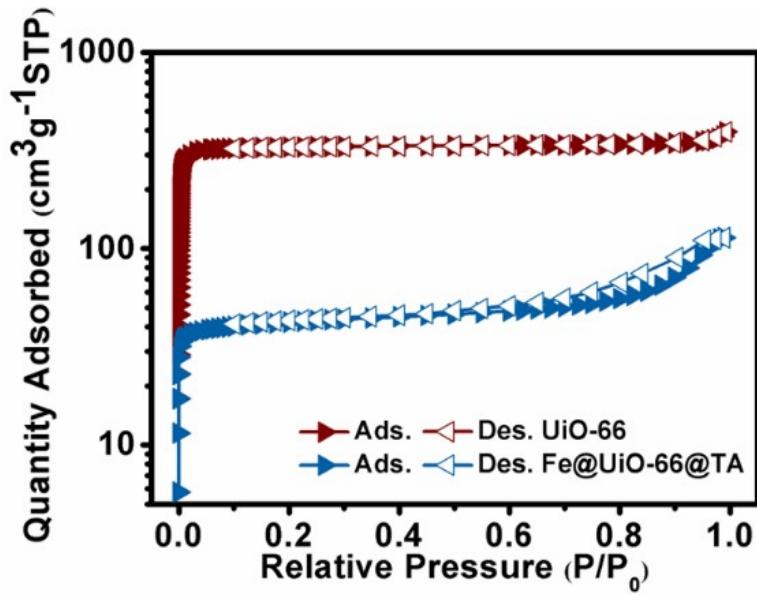

Fig. S3. N₂ adsorption-desorption isotherms of UiO-66 and Fe@UiO-66@TA particles.

Table 1. BET surface area of the UiO-66 and Fe@UiO-66@TA nanoparticles.

Entry	Sample	BET surface area (m ² /g)
1	UiO-66	957.8363 ± 27.7228 m ² /g
2	Fe@UiO-66@TA	128.2058 ± 3.0924 m ² /g

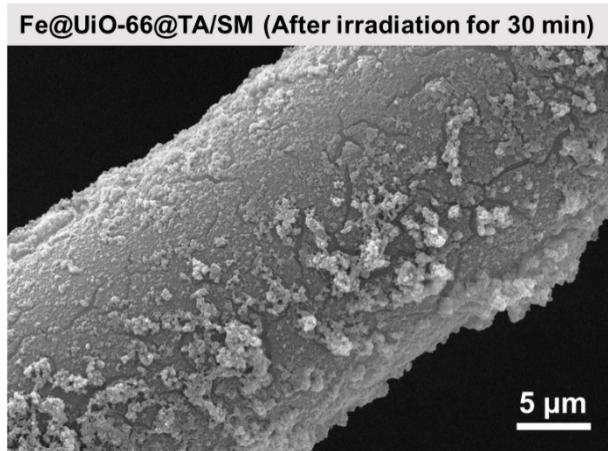

Fig. S4. SEM image of Fe@UiO-66@TA/SM after exposing under simulated sunlight for 30 min.
