Experimental Section

Synthesis and Growth of Crystals

All chemical reagents used in this work were obtained from commercial sources without further purification. The synthesis of the ligands 2,5-FBTA can refer to previous reports. Weigh 2 mmol 2,5-FBTA in a beaker, dissolve it with 15 mL methanol solution, then add hydrobromic acid, and then add 2 mmol MnBr₂. After complete dissolution, it slowly evaporates at room temperature, and after a few weeks, a green FBTAM-Br massive crystal is obtained. The crystals of FBTAM-Cl and FBTAM-I were obtained by the same method.

Detailed methods of measurements

Variable-Temperature Single-crystal XRD

The Rigaku Saturn 724 diffractometer with Mo K α radiation ($\lambda = 0.71073 \text{ \AA}$) was used to obtain single crystal X-ray diffraction data. The direct method was used to solve the variable temperature crystal structure data, and the SHELXL software was used to analyze and refine the crystal structure. Import the generated CIF file into DIAMOND to draw the corresponding asymmetric cell diagram and stack diagram, and calculate the selected bond distances and angles through Mercury. Table S1-S8 summarize the data collection of these crystals. These X-ray crystal structures have been stored at the Cambridge Crystallography Data Center (storage number CCDC 2368921-2368925) and are available free of charge from CCDC at www.ccdc.cam.ac.uk/getstructures.

DSC Measurement

Grind crystal into powder, weigh about 10 mg of powder, and place it in an aluminum crucible. Under nitrogen protection of the environment, the NETZSCH DSC 214 Polymer instrument is used to uniformly heat and cool at a rate of 20 K/min.

Dielectric Measurement

Press the powder sample into sheets, use conductive silver glue and copper wire as the medium, and connect the sheet sample to both ends of the electrode to make a capacitor. The complex dielectric constant at different frequencies was measured using Tonghui TH2828A instrument at 1V AC voltage.

Powder X-ray diffraction

Powder X-ray diffraction (PXRD) measurements were performed at room temperature on a Rigaku SmartLab SE X-ray diffractometer. The diffraction pattern is recorded at 2 θ between 0-50° within the range, the step size is 0.01°. Variable temperature powder X-ray diffraction pattern tested in the temperature range of 298-433 K through programmed heating and cooling.
