EXPERIMENTAL SECTION

Materials. CuI (>99.5%, Aladdin), triethylenediamine (ted, 98%, Macklin), 1-bromopropane (>99.0%, Macklin), 1-bromobutane (>99.0%, Macklin), 1-bromopentane (>99.0%, Macklin), potassium iodide (99.21%, Bidepharm), methanol (99.5%, Macklin), dimethyl sulfoxide-d6 (DMSO-d6, D.99.9% +0.03% TMS, Macklin), acetonitrile (AR, Macklin), polydimethylsiloxane (PDMS, AR, Macklin) and deionized water. All reagents were used as received without further purification.

Preparation of R-ted-R ligands. 10 mmol triethylenediamine (ted, 1.12 g) was dissolved in 5 mL of acetonitrile. Under magnetic stirring, 5 mL acetonitrile solution dissolved with 40 mmol of bromoalkane was dropwise added into the ted acetonitrile solution and stirred for 2 days to obtain the white precipitate. And the reaction solution is then poured out, leaving only the powder product, which is washed with cyclohexane and finally dried under vacuum. All ligands were dissolved in methanol at the concentration of 3 mL methanol/1 mmol ligand and prepared into methanol solution for use.

Synthesis of crystals of compounds 1-3. Single crystals were prepared by a slow diffusion method. In a glass sample bottle, 1 mmol CuI (0.19 g) was dissolved in 5 mL saturated KI solution, and then

2 mL acetonitrile was dropwise added. Finally, 3 mL methanol solution containing the ligand was slowly dribbled into the solution (the ligand dosage was 1 mmol). After a few days, transparent crystals grow out in the bottle, and the crystals emit bright yellow light under the ultraviolet lamp. Scoop out the crystals, and then add a small amount of ethanol to carefully rinse the crystals, and finally dry the crystals under vacuum.

Synthesis of powder of compounds 1-3. The 1 mmol R-ted-R ligand was dissolved in 3 mL methanol solution, and then 5 mL saturated KI solution dissolved with 1 mmol CuI was dropped into the solution to immediately produce a large amount of powder, which was illuminated with bright yellow light by 365 nm UV lamp. Then the product was centrifuged and washed with deionized water three times to remove KI in the solution, and then washed with anhydrous ethanol again and dried in vacuum. Finally, the powder was collected and weighed, and the product masses of compounds **1**, **2** and **3** were 168.4 mg, 545 mg and 284 mg, respectively.

LC-MS and $^1\text{H-NMR}$ analyses. Liquid chromatography-mass spectrometry (LC-MS, Thermo Fisher, UltiMate3000 ISQESI) and 600 M nuclear magnetic resonance hydrogen spectrum ($^1\text{H-NMR}$, Bruker Switzerland AG, AVANCE NEO 600) to verify the successful synthesis of the R2-ted organic ligand and test the purity of the product. Mass spectrometry: All ligands were synthesized into 2 mg/mL methanol solution under direct injection and ESI+ detection mode, and the ion source was Electron Spray Ionization (ESI). $^1\text{H-NMR}$ spectroscopy: 5-10 mg ligand dissolved in 0.5 mL dimethyl sulfoxid-D6 deuterium.

Microscope images. The crystal micrographs were obtained by using a MIT500 metallographic microscope. The glow micrographs were obtained in the dark under the illumination of a 365 nm ultraviolet LED.

Single-crystal X-ray diffraction (SCXRD). Single crystal data was collected on a Bruker D8 Venture METALJET Ga-Target SC-XRD under test temperature (T) of 100 K and radiation wavelength (λ) of 0.71073 Å. The structure was solved by direct method and refined by full-matrix least-squares on F^2 using the Bruker SHELXTL package. The data can be obtained free of charge from The Cambridge Crystallographic Data Centre (CCDC) via www.ccdc.cam.ac.uk/data_request/cif. The structures of compounds **1-3** are deposited in CCDC with deposition number of 2368508, 2368509 and 23685010, respectively.

Powder X-ray diffraction (PXRD). PXRD data were collected on the Rigaku Ultima IV automated

diffraction system with an X-ray source of 1.54056 Å Cu K α 1 and a power of 40 kV/40 mA (5-50°, 10°/min).

X-ray photoelectron spectroscopy (XPS) tests. The XPS spectra of compounds **1-3** were obtained by an X-ray photoelectron spectrometer (SHIMADZU AXIS SUPRA+).

Optical diffuse reflectance measurements. Optical diffuse reflectance spectrum was measured on the UV-2600 spectrophotometer from Shimadzu using BaSO₄ powder as the reflectivity reference. the optical bandgap was calculated by use of a typical Tauc method by employing the equation: $(\alpha h\nu)^n = A(h\nu - E_g)$, where α , h , ν , A , and E_g are the absorption coefficient, Plank's constant, light frequency, a constant, and band gap. The value of n here is 2 presuming that compounds **1-3** are direct transition semiconductors.

Thermogravimetric (TG) analysis. The TG analysis was performed on the TG analyzer (Netzsch TG 209 F1 Libra R) and was heated from room temperature to 800 °C under nitrogen flow at a rate of 10 °C/min.

Photoluminescence/radioluminescence related measurements. Photoluminescence emission (PL) and excitation (PLE) measurements, radioluminescence (RL), room temperature fluorescence decay curve and photoluminescence quantum yield (PLQY) tests were carried out on FLS1000 spectrofluorometer (Edinburgh Instruments). The fluorescent lifetime excitation source is Edinburgh EPLED-295/365 nm picosecond pulsed diode laser. An X-ray tube (Moxtek, TUB00154-9I-WO6, working condition: 50 kV, 20 μA) was used to collect the RL spectra, and BGO (Bi₄Ge₃O₁₂ crystal, a known reference material) was used for comparison.

Fabrication of flexible scintillator screens. 0.50 g compound **3** and 1.00 g PDMS were mixed uniformly and then dropped on the glass substrate, and then a thin film with uniform thickness was prepared by spin coating. The spin-coated films can be peeled off the glass substrate after curing at 120 °C overnight.

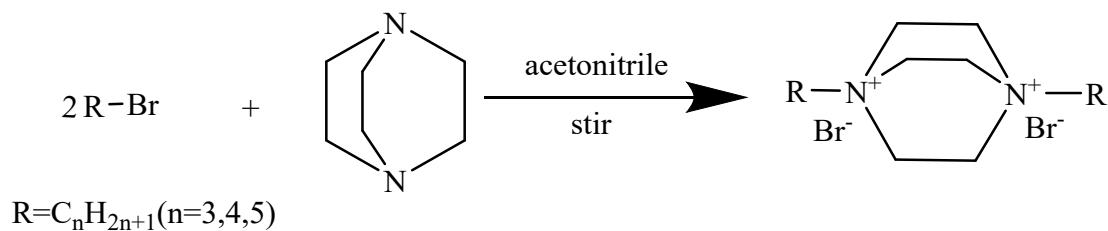

Figure S1. Synthesis of disubstituted ted derivative ligands.

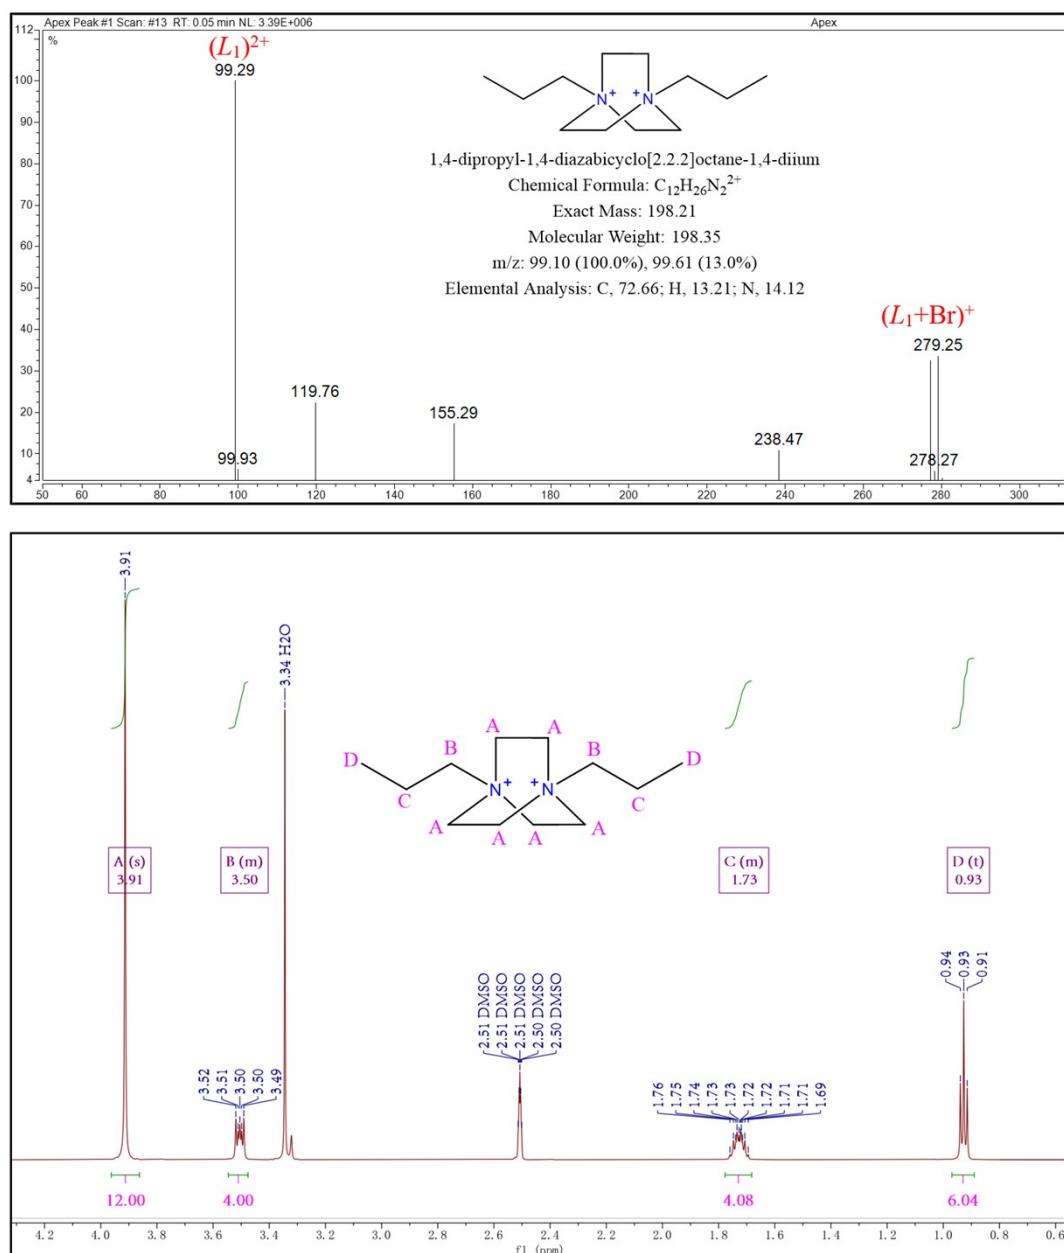

Figure S2. MS (top) and ^1H -NMR (bottom) spectra of R-ted-R organic ligand L₁. The inset is for its molecular structure. ^1H NMR (600 MHz, DMSO- d_6) δ 3.91 (s, 12H), 3.55 – 3.48 (m, 4H), 1.78 – 1.68 (m, 4H), 0.93 (t, J = 7.3 Hz, 6H).

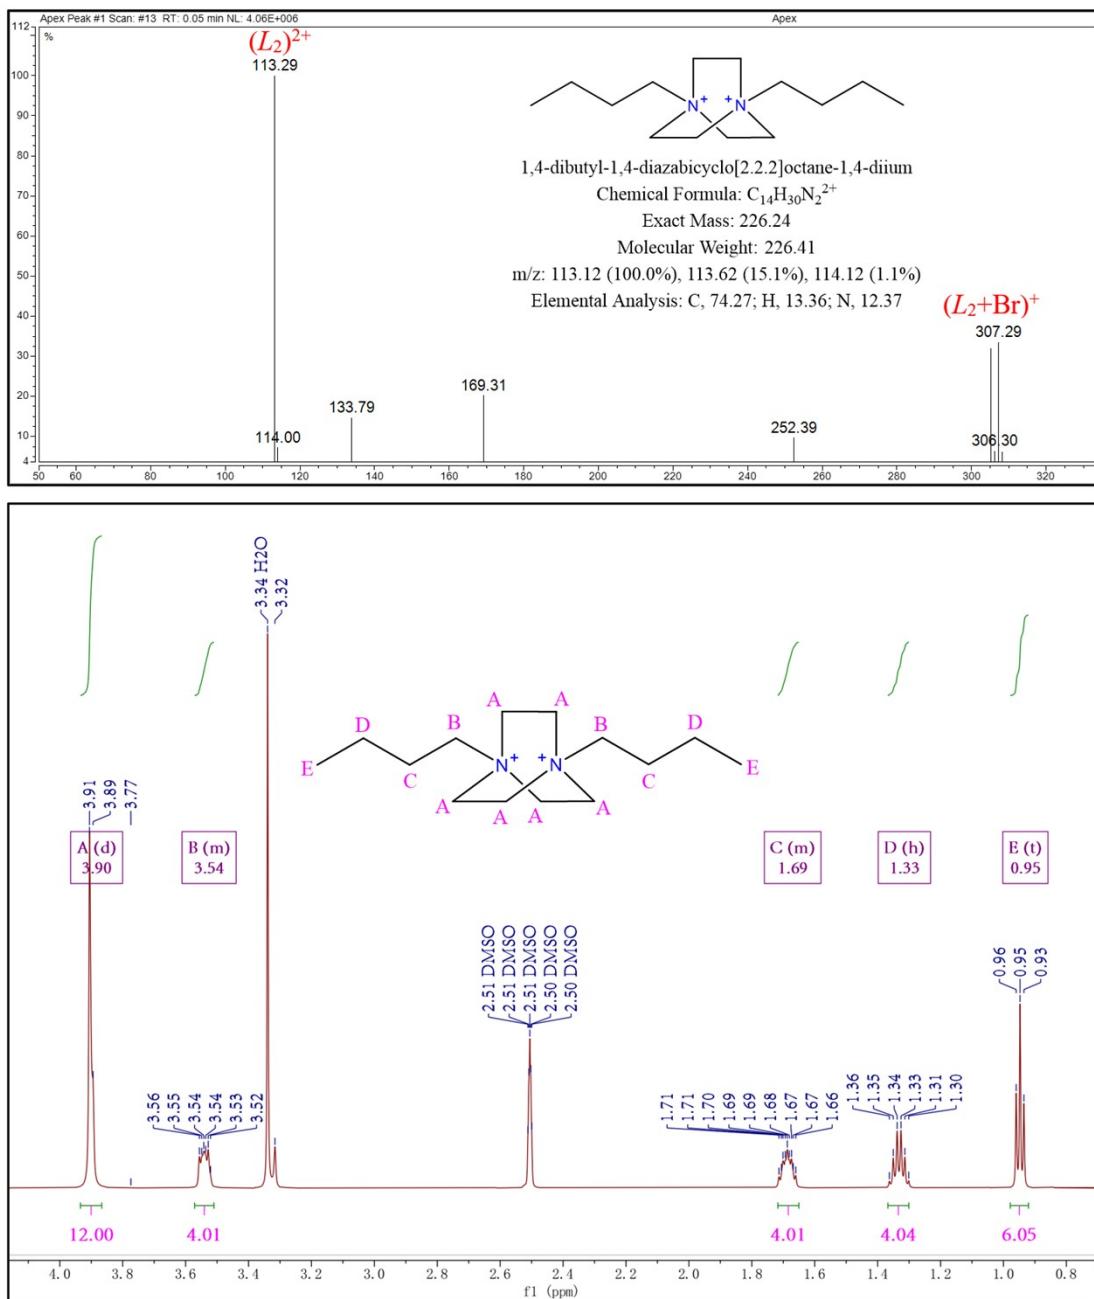

Figure S3. MS (top) and 1H -NMR (bottom) spectra of R-ted-R organic ligand L_2 . The inset is for its molecular structure. 1H NMR (600 MHz, DMSO- d_6) δ 3.90 (d, J = 6.8 Hz, 12H), 3.57 – 3.51 (m, 4H), 1.73 – 1.65 (m, 4H), 1.33 (h, J = 7.4 Hz, 4H), 0.95 (t, J = 7.4 Hz, 6H).

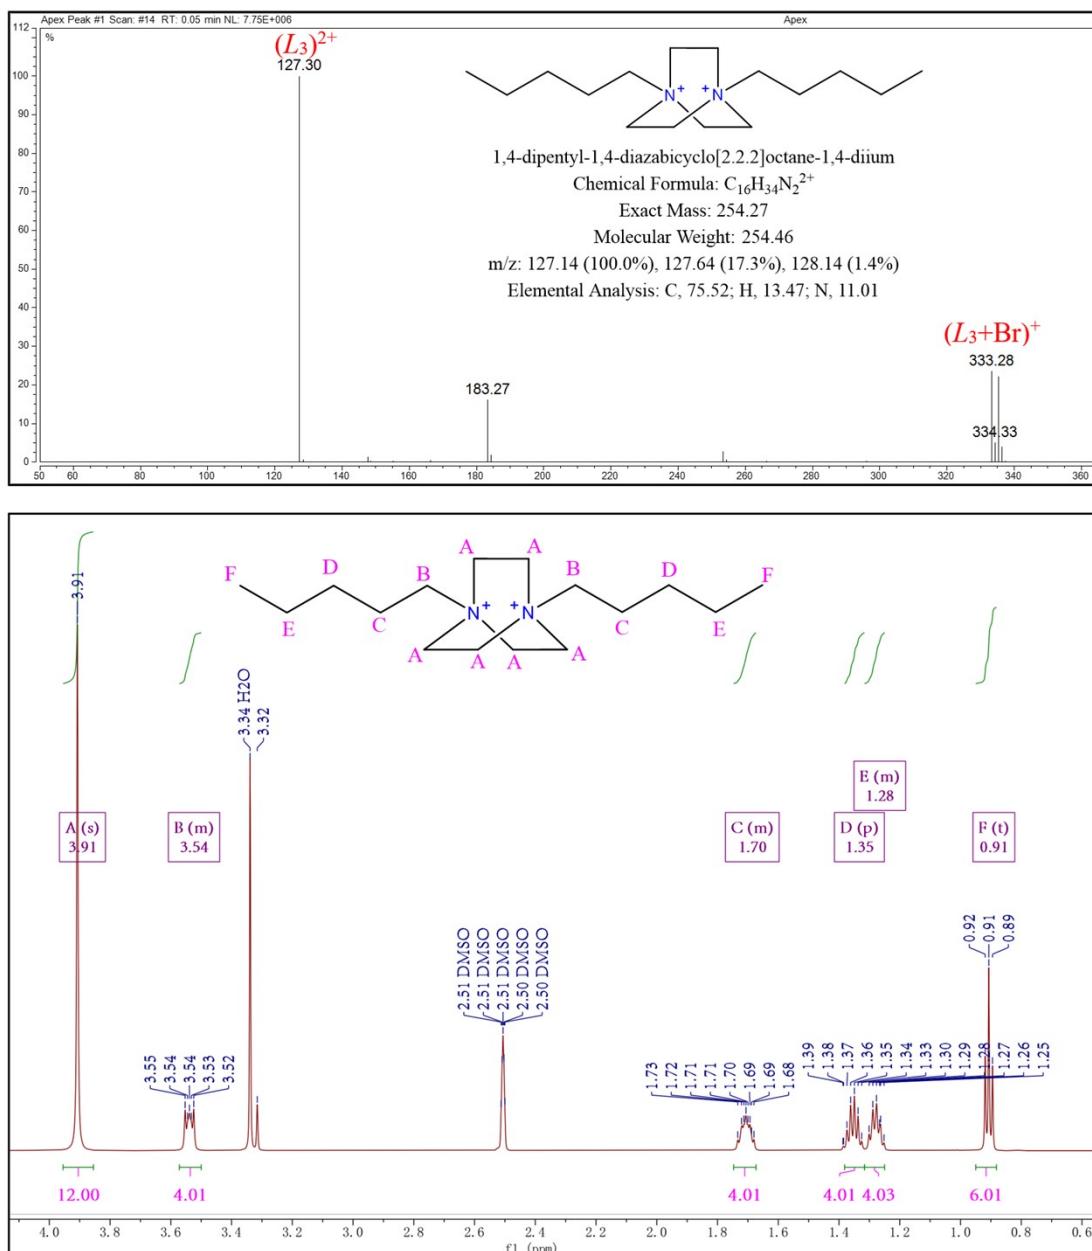

Figure S4. MS (top) and ^1H -NMR (bottom) spectra of R-ted-R organic ligand L₃. The inset is for its molecular structure. ^1H NMR (600 MHz, DMSO-*d*₆) δ 3.91 (s, 12H), 3.57 – 3.50 (m, 4H), 1.75 – 1.67 (m, 4H), 1.35 (p, *J* = 7.2 Hz, 4H), 1.32 – 1.25 (m, 4H), 0.91 (t, *J* = 7.2 Hz, 6H).

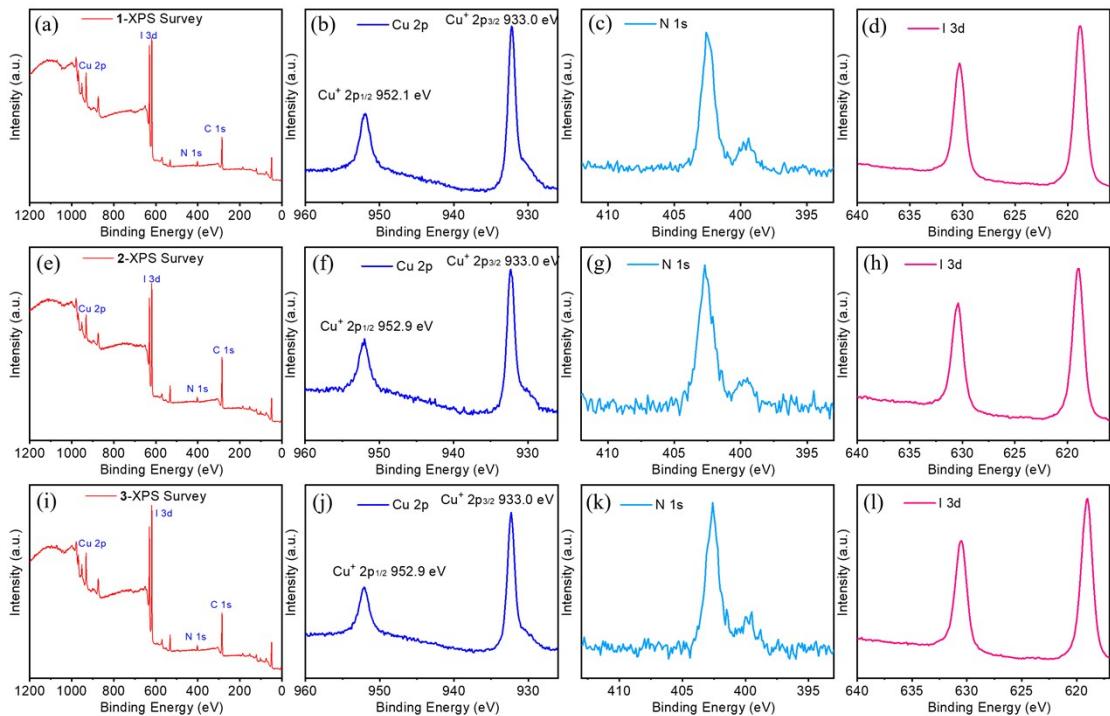

Figure S5. X-ray photoelectron spectroscopy (XPS) survey spectra and high-resolution XPS spectra of Cu 2p, N 1s and I 3d of compounds (a-d) **1**, (e-h) **2** and (i-l) **3**, respectively.

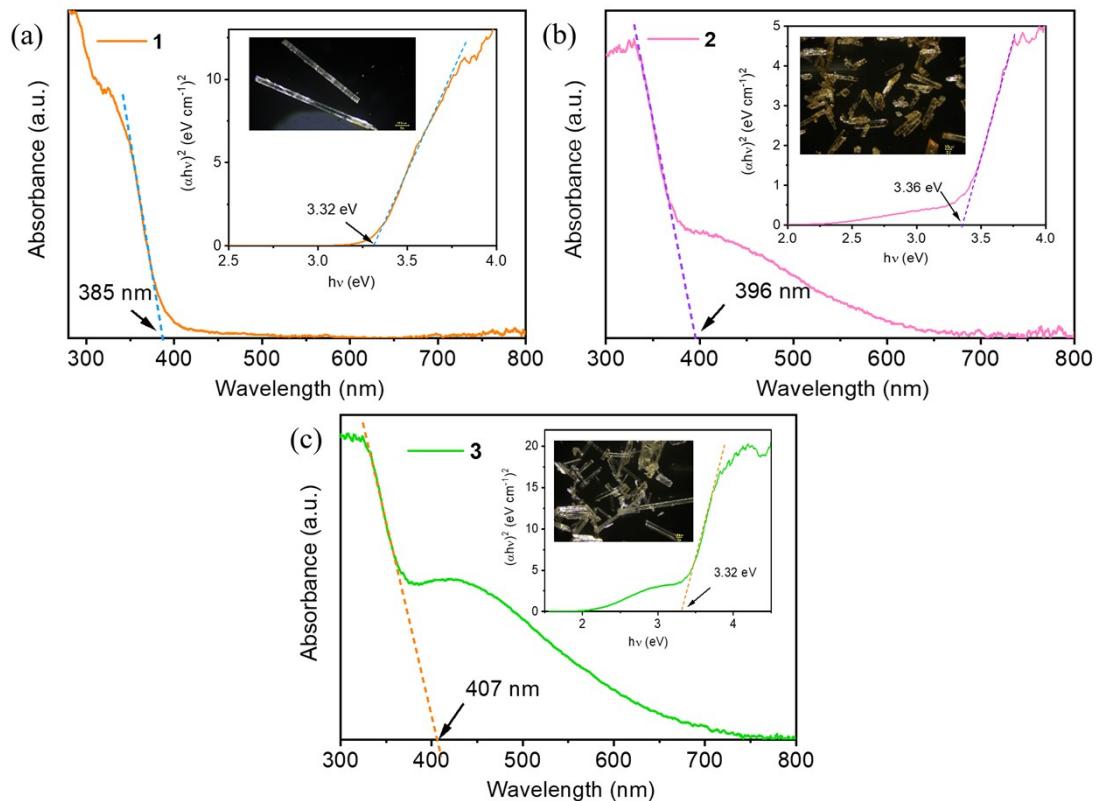

Figure S6. (a-c) UV-Vis diffuse reflectance spectra of compounds **1-3** (insets are Tauc curves and microscope images of crystals under natural light), respectively.

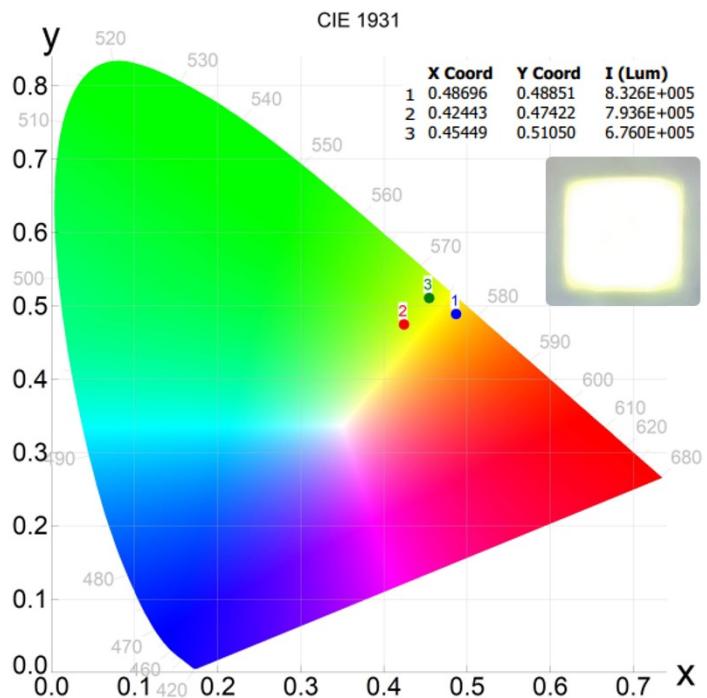

Figure S7. CIE color coordinates of compounds **1-3**. Inset: luminescent coating made by **3**.

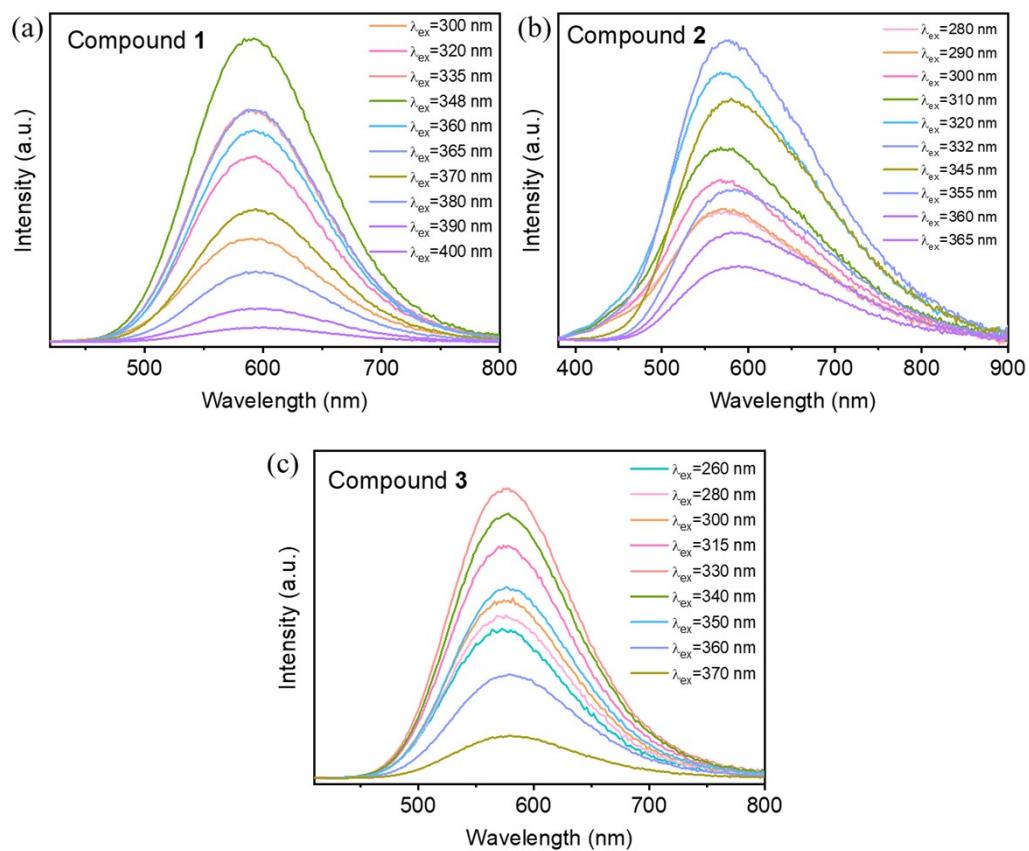

Figure S8. Emission spectra of compounds **1-3** under light excitation of different energies.

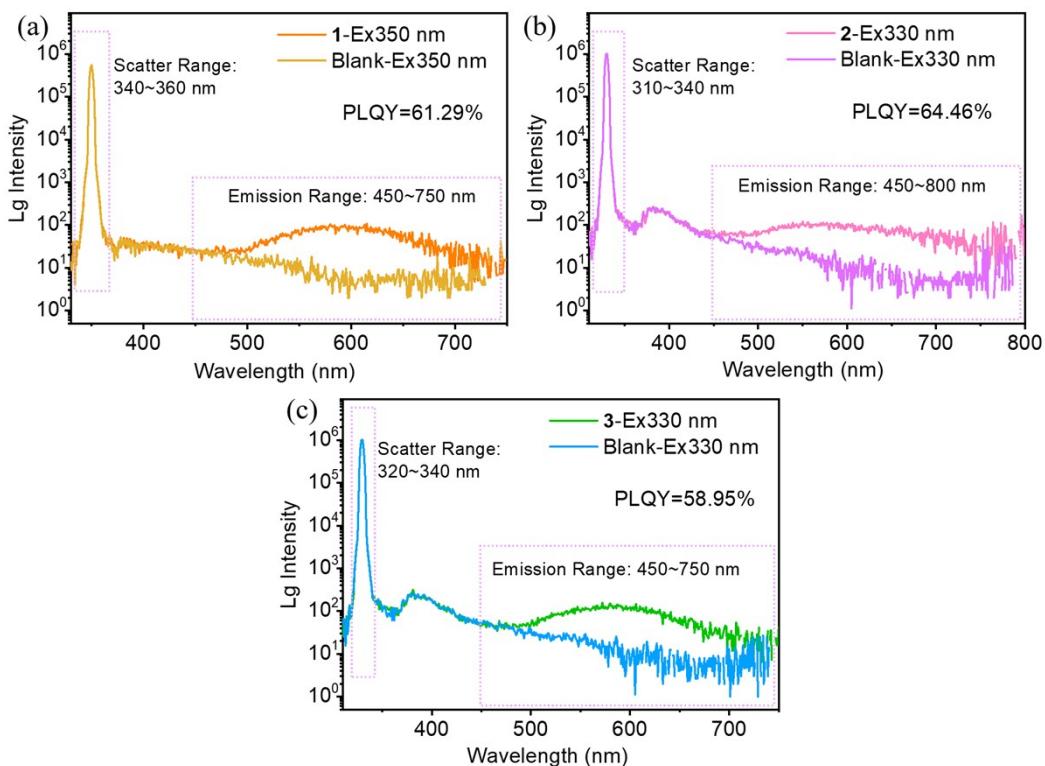

Figure S9. Photoluminescent quantum yield analysis curves of compounds **1-3**.

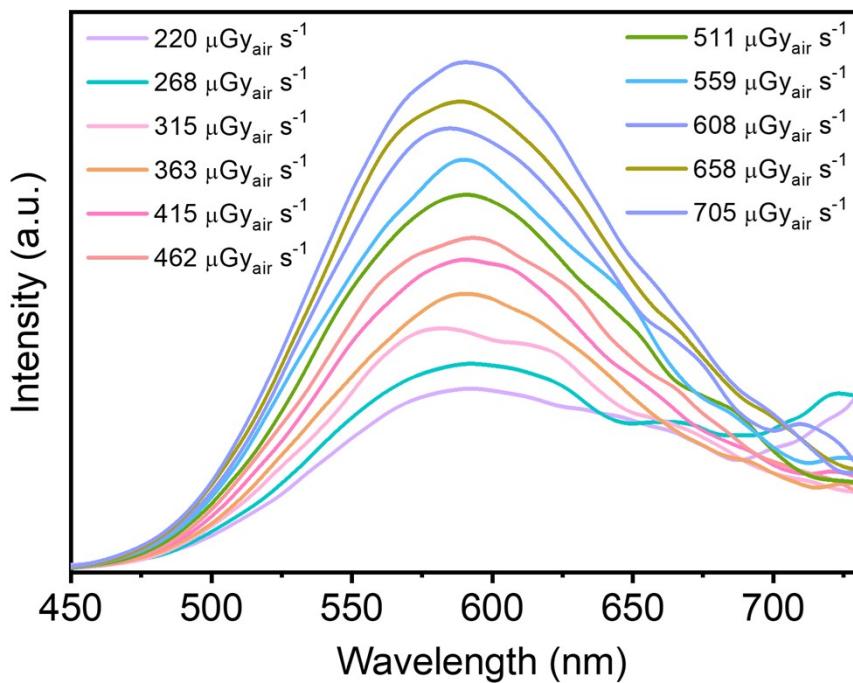

Figure S10. Radioluminescence (RL) spectra of compound **3** in the dose rate range of 220 to 705 $\mu\text{Gy}_{\text{air}} \text{s}^{-1}$.

Table S1. Preparation information of three R-ted-R organic ligands.

Ligand number	Systematic name	Abbreviation	Corresponding bromoalkane and its dosage	Yield
L ₁	1,4-dipropyl-1,4-diazabicyclo[2.2.2]octan-1,4-diium bromide	Pr-ted-Pr	1-bromopropane, 4.92 g	63%
L ₂	1,4-dibutyl-1,4-diazabicyclo[2.2.2]octan-1,4-diium bromide	Bu-ted-Bu	1-bromobutane, 5.48 g	55%
L ₃	1,4-dipentyl-1,4-diazabicyclo[2.2.2]octan-1,4-diium bromide	Pen-ted-Pen	1-bromopentane, 6.04 g	49%

Table S2. Summary of single crystal analysis data of compounds **1-3**.
