General information

(n-$Bu_4N)_4[\beta$-$Mo_8O_{26}]$[1] and the chalconium salts[2,3] were prepared according to the literature data. Other reagents were of commercial quality (Sigma–Aldrich) and were used without additional purification. Elemental analyses were carried out on a MICRO Cube CHN analyzer. IR spectra were recorded on a Bruker Vertex 60 FT-IR spectrometer. IR spectrum for **9** was recorded on a Shimadzu IRAffinity-1. Electrospray ionization (ESI) mass spectra (for **8**) were obtained on a Bruker maXis spectrometer equipped with an ESI source. The instrument was operated in positive ion mode using an m/z range of 50–1200. The nebulizer and drying gas flows were set to 1.0 bar and 4.0 L min^{-1}, respectively. For high resolution electrospray ionization (HRESI+), the studied compound was dissolved in MeOH. ^1H- and $^{13}C\{^1H\}$ NMR spectra were measured on a Bruker Avance 400 spectrometer in $(CD_3)_2SO$ at 298 K; the residual solvent signal was used as the internal standard.

Synthesis of $[S(bPh)Ph]_4[\beta$-$Mo_8O_{26}]$ (**1**): Solid [S(bPh)Ph](OTf) (0.038 g, $9.3\cdot10^{-5}$ mol) was added to the solution of $(Bu_4N)_4[\beta$-$Mo_8O_{26}]$ (0.050 g, $2.3\cdot10^{-5}$ mol) in 3 mL of DMF under gentle stirring. X-ray single-crystal diffraction studies

The diffraction data for **1 - 7** were collected on a Bruker D8 Venture diffractometer with a CMOS PHOTON III detector and IμS 3.0 source (Mo Kα radiation, λ = 0.71073 Å) at 150 K. The φ- and ω-scan techniques were employed. Absorption correction was applied by SADABS (Bruker Apex3 software suite: Apex3, SADABS-2016/2 and SAINT, version 2018.7-2; Bruker AXS Inc.: Madison, WI, 2017). The structures were solved by SHELXT[4] and refined by full-matrix least-squares treatment against $|F|^2$ in anisotropic approximation with SHELX 2019/3[5] in ShelXle program[6].

The diffraction data for **8 – [9]·2CH$_3$OH** were collected on a «SuperNova» (Agilent Technologies) diffractometer with monochromated CuKα radiation. Crystals were kept at 100(2) K during data collection. Structures have been solved by the Superflip[789], and the ShelXT[4] solution programs using Charge Flipping and Intrinsic Phasing and refined by means of the ShelXL[5] program incorporated in the OLEX2 program package[10]. H-atoms were refined in geometrically calculated positions.

Mass spectrometry

The high-resolution electrospray ionization mass spectrometric (HR-ESI-MS) measurements were performed at the Center of Collective Use «Mass spectrometric investigations» SB RAS. Spectra were obtained with a direct injection of liquid samples on an ESI quadrupole time-of-flight (ESI-Q-TOF) high-resolution mass spectrometer Maxis 4G (Bruker Daltonics, Germany). The spectra were recorded in the 300-3000 m/z range in negative mode.

Computational details

The single point calculations based on the experimental X-ray geometries of structures **1-[9]·2CH$_3$OH** were carried out at the DFT level of theory using the dispersion-corrected hybrid functional ωB97XD[11] with the help of Gaussian-09[12] program package (X-ray structures **3** and **4** were not used for computational studies because they did not featuring any interesting noncovalent interactions involving chalcogen atoms, also X-ray structure **4** has disordering in the cationic moiety). The Douglas–Kroll–Hess 2nd order scalar relativistic calculations requested relativistic core Hamiltonian were carried out using the DZP-DKH basis sets[13–16] for all atoms. The topological analysis of the electron density distribution with the help of the atoms in molecules (QTAIM) method developed by Bader[17] has been performed by using the Multiwfn program (version 3.7)[18].

Note that electrostatic, charge-transfer and dispersion terms have been identified as significantly contributing to such type of noncovalent interactions[19,20], especially when using heavier chalcogens as σ-hole donors.[21] Indeed, results of cation-cluster intermolecular interaction energies analysis performed in CrystalExplorer program [https://crystalexplorer.net/] based on the X-ray structure of **8** reveal following electrostatic, dispersion, polarization and exchange-repulsion terms: 1.019, 0.651, 0.901, and 0.811 (CE-HF model) or 1.057, 0.740, 0.871, and 0.618 kJ/mol, respectively (CE-B3LYP model).
