54 **1. Experimental**

55 **1.1 Materials**

56 All chemicals were analytically pure and were used as purchased, without any
57 further purifications. Zirconyl Chloride Octahydrate, 98% was purchased from
58 Shanghai Adamas Reagent Co., Ltd. Absolute ethanol, Cerium nitrate hexahydrate
59 99.5%, Trifluoroacetic acid AR, p-Phthalic acid 99% were purchased from Shanghai
60 Macklin Biochemical Technology Co., Ltd. Deionized water was used throughout the
61 electrochemical measurements and materials preparation.

62 **1.2 Material characterization**

63 The synthesized D-D-UIO-66 materials were characterized by the powder X-ray
64 diffraction (XRD; Rigaku XRD-6100, Japan); scanning electron microscopy (SEM,
65 Hitachi SU8010, Japan) with energy dispersive X-ray spectroscopy (EDX) and
66 transmission electron microscopy (TEM; FEI Talos F200X G2, USA); X-ray
67 photoelectron spectroscopy (XPS; Thermo Scientific K-Alpha, USA) was conducted
68 using monochromatic Al K α X-ray source; The specific surface areas were obtained
69 from N₂ adsorption desorption isotherms at 77 K with BET surface area analyzer (BET;
70 Micromeritics, ASAP 2460, GA, USA); Thermogravimetric analysis (TG)
71 measurements were made with a DSC/DTA-TG unit (Rigaku TG/DTA8122, Japan)
72 under N₂ atmosphere from 30 °C to 800 °C at heating rate of 10 °C min⁻¹; The
73 concentration of HMIs was determined by a Contra 700 (Analytik Jena, Germany)
74 Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES).

75 **1.3 Inkjet printing**

76 The ink was filtrated through a filter with a pore size of 0.45 μm before printing.
77 Picolitre drops of the ink were ejected from a dope-on-demand inkjet system RD-
78 PMF100 (MicroFab Technologies) onto the glassy carbon electrode (GCE). Printing
79 was performed at a voltage pulse of 27 V with a droplet velocity of 1.24 m s^{-1}

80 **1.4 HMIs detection**

81 All electrochemical experiments were performed on an electrochemical
82 workstation (CHI 760E, CH Instruments Inc., Shanghai, China) with a conventional
83 three-electrode system, where the bare or D-D-UIO-66/GCE modified electrode,
84 Ag/AgCl and platinum wire electrode served as the working, reference, and auxiliary
85 electrodes, respectively. The differential pulse anodic stripping voltammetry (DPASV)
86 measurement was utilized for the observation of electrochemical detection behavior
87 toward Pb(II), Cd(II), Cu(II), and Hg(II) under optimized experimental conditions. The
88 actual water is first filtered to remove insoluble impurities, then diluted with a 0.1 M
89 HAc–NaAc buffer solution to form a real water sample with a volume ratio of 1:9.

90 **1.5 HMIs adsorption**

91 **Adsorption isotherms.** During an isotherm adsorption experiments, 20 mg adsorbents were
92 dispersed in 20 mL Pb(II) aqueous solution with initial concentrations ranged from 100 to 1000 mg
93 L^{-1} . The adsorption process performed in a shaker at 200 rpm for 700 minutes at 25 $^{\circ}\text{C}$. The
94 adsorption capacity of Pb(II) on four adsorbents was calculated using Eq. (1):

$$95 \quad Q_e = \frac{V(C_0 - C_e)}{m} \quad (1)$$

96 Where Q_e is the equilibrium adsorption capacity (mg L^{-1}), C_0 and C_e are the initial and
97 equilibrium concentration of Pb(II) (mg L^{-1}), respectively, m is the mass of adsorbents (g), V is the

98 volume of Pb(II) solution (L). The isotherm adsorption dates were analyzed using Langmuir Eq. (2)

99 and the Freundlich Eq. (3) isotherm model at 25 °C

100
$$Q_e = \frac{K_L Q_m C_e}{1 + K_L C_e} \quad (2)$$

101
$$Q_e = K_F C_e^{1/n} \quad (3)$$

102 Where C_e (mg g⁻¹) is the equilibrium concentration of the Pb(II) solution, Q_e (mg g⁻¹) is the
103 equilibrium adsorption capacity of the adsorbent, Q_m (mg g⁻¹) is the theoretical maximum adsorption
104 capacity, K_L (L mg⁻¹) represents Langmuir constant, K_F (mg^{-1/n}L^{-1/n} g⁻¹) and n represents Freundlich
105 constant.

106 **Adsorption kinetics.** Adsorption kinetics was conducted by adding 100 mg of the four
107 adsorbents into a 100 mL Pb(II) solution with initial concentrations 1000 mg L⁻¹ at 25 °C. The
108 kinetic dates were examined by the pseudo-first-order Eq. (4) and pseudo-second-order model Eq.
109 (5):

110
$$\ln(Q_e - Q_t) = \ln Q_m - k_1 t \quad (4)$$

111
$$\frac{t}{Q_t} = \frac{1}{k_2 Q_m^2} + \frac{t}{Q_m} \quad (5)$$

112 Where Q_t is the adsorption capacity of the adsorbent at time t and Q_m (mg g⁻¹) and at
113 equilibrium, respectively, k_1 (min⁻¹) and k_2 (g mg⁻¹ min⁻¹) are the corresponding rate constants.

114
