## 1. General Considerations

**1.1 General:** For purple and blue light irradiation a Kessil PR160-purple LED lamp (30 W High Luminous DEX 2100 LED,  $\lambda_{\text{max}} = 390 \text{ nm}$ ), a Kessil PR160-blue LED lamp (30 W High Luminous DEX 2100 LED,  $\lambda_{\text{max}} = 427 \text{ nm}$ ) or a Kessil PR160-blue LED LED lamp (30 W High Luminous DEX 2100 LED,  $\lambda_{\text{max}} = 456 \text{ nm}$ ) was placed 4 cm away from the reaction vials. NMR spectra ( $^1\text{H}$ ,  $^{13}\text{C}$ ,  $^{19}\text{F}$ ) were acquired on a Bruker Avance 300 and 500 MHz spectrometers. Chemical shifts ( $\delta$ ) are reported in ppm relative to residual solvent signals ( $\text{CDCl}_3$ ,  $\delta_{\text{H}} = 7.26 \text{ ppm}$ ,  $\delta_{\text{C}} = 77.16 \text{ ppm}$ ).  $^{13}\text{C}$  NMR and  $^{19}\text{F}$  spectra were acquired on a broad band decoupled mode. The following abbreviations are used to describe peak patterns when appropriate: s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet), bs (broad singlet). Analytical thin layer chromatography (TLC) was performed using pre-coated aluminum-backed plates (60 Å porosity, 250  $\mu\text{m}$  thickness) in heptane/EtOAc as the eluent, and visualized using bromocresol, ninhydrin, vanillin, *p*-anisaldehyde stain, and/or UV light. Reactions were monitored by  $^1\text{H}$  NMR, and/or TLC. Flash column chromatography was accomplished using silica gel Merck-60 from Aldrich. High Resolution Mass Spectrometry (HRMS) were registered in a spectrometer Bruker maXis IITM (Q-TOF) or a GCT Agilent Technologies 6890 N using Atmospheric Pressure Chemical Ionization (APCI) or Electrospray Ionization (ESI) method. Melting points ( $^{\circ}\text{C}$ ) were measured using Büchi Melting Point B-540 apparatus in open capillary tubes, and the values are uncorrected. UV/vis measurements were measured in a 1 cm quartz cuvette using a JASCO V-660 UV/vis spectrophotometer. The continuous-flow experiment was carried out using a homemade flow setup with a syringe pump (Chemex Fusion 100), two Kessil lamps, and 1.36 mL perfluoroalcoxy (PFA) reactor coil (inner diameter: 1.6 mm, external diameter 3.0 mm). Photoredox-catalyzed reactions were performed using 8 mL Screw Neck Vial (clear glass, 45 x 14.7 mm) with screw cap 13 mm black Sil/PTFE septum.

**1.2 Chemicals:** Deuterated NMR solvents were purchased and stored over 4 $\text{\AA}$  molecular sieves. Dry acetone, AcOEt, DMA, DMF and DMSO were obtained from ThermoFisher and used as received. MeCN, THF and  $\text{CH}_2\text{Cl}_2$  were purchased and dried using a solvent delivery system. Alcohols, triphenylphosphine, *N*-hydroxyphthalimide, DIAD, DMAP, hydrazine hydrate, pyruvic acid, and EDC·HCl were purchased from commercial suppliers and used as received. Diphenylmethanone oxime<sup>12</sup> and 6-(2-isopropyl-5-methylphenoxy)hexan-1-ol<sup>13</sup> were synthesized following reported procedures. All the photocatalyst were purchased from commercial suppliers and used as received, except for 4CzIPN<sup>14</sup> and 5CzBN<sup>15</sup>, which were synthesized following reported procedures.

**1.3 Computational details:** DFT calculations were performed with Gaussian 16.<sup>16</sup> First, all the energies were obtained with the spin unrestricted UB3LYP<sup>17</sup>-D3<sup>18</sup>/def2-SVP<sup>19</sup> method, in acetone solvent using the CPCM solvent model<sup>20</sup> with “opt=noeigen” and “guess=mix” keywords. Harmonic frequencies were calculated at the same level to characterize the stationary points and to determine the zero-point energies (ZPE), as well as obtaining the thermochemistry: enthalpy ( $\Delta H$ ) and free energy ( $\Delta G$ ) at the temperature of 298 K. For the input structure of **1a**, a conformational search was carried out at semiempirical PM6 level with Spartan '20.

## 2. Synthesis of Starting Materials

### 2.1 General Procedure A: Synthesis of $\alpha$ -Oxime Acids and $\alpha$ -Hydrazone Acids

All the acids **S2** were synthesized from the corresponding alcohols, alkyl halides or tosyl amines, according to the literature procedure.<sup>21</sup>

#### - General Procedure A1: Primary and Secondary Alcohols

**Synthesis of phtalimide S1.** A solution of the correspondig alcohol (1.0 equiv), *N*-hydroxyphthalimide (1.2 equiv) and triphenylphosphine (1.20 eq.) in THF (0.25 M) under a nitrogen atmosphere was cooled to 0 °C with an icebath. Diisopropylazodicarboxylate (1.2 equiv) was added dropwise to the solution at 0 °C. The resulting mixture was stirred at 0 °C for 10 minutes, after that the icebath was removed, and the reaction was stirred at room temperature for 16 h or until the reaction was complete by TLC analysis. Then, the reaction mixture was concentrated under reduced pressure, and the crude mixture was subjected to purification by flash column chromatography using heptane/ethyl acetate as the mobile phase. The resultant phtalimide **S1** was then used directly for the next step.

**Synthesis of  $\alpha$ -oxime acids S2.** To a stirred suspension of the previous phtalimide **S1** (1.0 equiv) in absolute ethanol (0.2 M), hydrazine (1.0 M in THF, 1.0 equiv) was added in a single portion. The mixture was stirred at room temperature for 5 hours, and the formation of a white precipitate was observed. The white solid was filtered off through a plug of Celite, and the filter pad was washed with a minimal amount of absolute ethanol. Then, pyruvic acid (3.0 equiv) was added to the solution, and the resulting mixture was stirred for 3 h at room temperature. Upon completion, the reaction mixture was concentrated under reduced preassure, and poured into 10% aq HCl soln. The mixture was poured into a separatory funnel, and extracted with AcOEt (2x20 mL). The combined organic layers were extracted with an aq NaOH soln (2 M, 4x20 mL). The combined basic aq layers were washed with AcOEt (2x20 mL), carefully acidified to pH 1 with con HCl, and extracted with AcOEt (3x20 mL). The combined organic layers were washed with satd NaCl soln, dried ( $Na_2SO_4$ ), and the volatiles were removed under reduced pressure. The resulttanting  $\alpha$ -oxime Acids **S2** was then used directly for the next step without further purification because problems in its isolation. (NOTE: No special caution for avoid O<sub>2</sub> in this reaction.)

- General Procedure A2: Primary and Secondary Alcohols

**Synthesis of pthalimide **S1**.** A solution of the corresponding alcohol (1.0 equiv), *N*-hydroxyphthalimide (1.2 equiv) and triphenylphosphine (1.20 eq.) in THF (0.25 M) under a nitrogen atmosphere was cooled to 0 °C with an icebath. Diisopropylazodicarboxylate (1.2 equiv) was added dropwise to the solution at 0 °C. The resulting mixture was stirred at 0 °C for 10 minutes, after that the icebath was removed, and the reaction was stirred at room temperature for 16 h or until the reaction was complete by TLC analysis. Then, the reaction mixture was concentrated under reduced pressure, and the crude mixture was subjected to purification by flash column chromatography using heptane/ethyl acetate as the mobile phase. The resultant pthalimide **S1** was then used directly for the next step.

**Synthesis of  $\alpha$ -oxime acids **S2**.** To a stirred suspension of the previous pthalimide **S1** (1.0 equiv) in absolute ethanol (0.2 M), hydrazine (1.0 M in THF, 1.0 equiv) was added in a single portion. The mixture was stirred at room temperature for 5 hours, and the formation of a white precipitate was observed. The white solid was filtered off through a plug of Celite, and the filter pad was washed with a minimal amount of absolute ethanol. Then, methyl pyruvate (3.0 equiv) and acetic acid (10.0 equiv) were added to the solution, and the resulting mixture was stirred for 12 h at room temperature. Upon completion, the reaction mixture was concentrated under reduced pressure, and washed with water. The crude mixture was subjected to purification by flash column chromatography (5-10 % AcOEt in heptane) to obtain the corresponding intermediate oxime ester. Then, this ester was dissolved in mixture of methanol/H<sub>2</sub>O (0.2 M, 3:1), and LiOH (3.0 equiv) was added. The resulting mixture was stirred at room temperature until the reaction was complete by TLC analysis (3-5 h). The reaction was concentrated under reduced pressure, acidified using a 10% aq HCl soln, and extracted with AcOEt (2x20 mL). The combined organic layers were dried ( $\text{Na}_2\text{SO}_4$ ), and the volatiles were removed under reduced pressure, obtaining the pure product **S2**. (NOTE: No special caution for avoid O<sub>2</sub> in this reaction.).

- General Procedure A3: Alkyl Halides

Synthesis of phtalimide S1. To a solution of the corresponding alkyl halide (1.0 equiv) and *N*-hydroxyphthalimide (1.2 equiv) in DMF (1.0 M), DBU (2.0 equiv) was added, and the resulting mixture was stirred at 90°C for 3 h. The reaction was quenched with a 10% aq HCl soln, and extracted with AcOEt (3x20 mL). The combined organic layers were washed with satd NaCl soln three times, dried ( $\text{Na}_2\text{SO}_4$ ), and the volatiles were removed under reduced pressure. The crude mixture of **S1** was used to the next step without further purification. (NOTE: No special caution for avoid O<sub>2</sub> and H<sub>2</sub>O in this reaction.).

Synthesis of  $\alpha$ -oxime acids S2. To a stirred suspension of the previous phtalimide **S1** (1.0 equiv) in absolute ethanol (0.2 M), hydrazine (1.0 M in THF, 1.0 equiv) was added in a single portion. The mixture was stirred at room temperature for 5 hours, and the formation of a white precipitate was observed. The white solid was filtered off through a plug of Celite, and the filter pad was washed with a minimal amount of absolute ethanol. Then, methyl pyruvate (3.0 equiv) and acetic acid (10.0 equiv) were added to the solution, and the resulting mixture was stirred for 12 h at room temperature. Upon completion, the reaction mixture was concentrated under reduced pressure, and washed with water. The crude mixture was subjected to purification by flash column chromatography (5-10 % AcOEt in heptane) to obtain the corresponding oxime ester. Then, this ester was dissolved in mixture of methanol/H<sub>2</sub>O (0.2 M, 3:1), and LiOH (3.0 equiv) was added. The combined organic layers were dried ( $\text{Na}_2\text{SO}_4$ ), and the volatiles were removed under reduced pressure, obtaining the pure product **S2**. (NOTE: No special caution for avoid O<sub>2</sub> in this reaction.).

#### - General Procedure A4: Tosyl Amines

To a solution of the corresponding tosyl amine (1.0 equiv) in dry NMP (Aldrich SureSeal™, 1.5 M), a 1.0 M solution of potassium hexamethyldisilazide in THF (1.1 equiv) was added at 0°C under inert atmosphere. The mixture was stirred at room temperature for 10-15 min, darkening with the time. Then, *O*-(4-nitrobenzoyl)hydroxylamine (1.00 eq.) was added, and the resulting mixture was stirred for other additional 15 min (monitoring by TLC because the hydrazide product usually stains yellow/orange using vanillin stain). The reaction was quenched with water (50 mL), and extracted with AcOEt (3 x 30 mL). The combined organic layers were washed with satd NaCl soln three times, dried ( $\text{Na}_2\text{SO}_4$ ), and the volatiles were removed under reduced pressure. (NOTE: This hydrazide is unstable and cannot be stored. It must be used immediately for the next step). Then, pyruvic acid (3.0 equiv) was added to a solution of the previous crude mixture in MeOH (0.2 M), and the mixture was stirred 18 h at room temperature. Upon completion, the reaction mixture was concentrated under reduced pressure, and washed with water. The organic layer was dried ( $\text{Na}_2\text{SO}_4$ ), and

the volatiles were removed under reduced pressure. The resultanting  $\alpha$ -hydrazone acid **S2** was then used directly for the next step without further purification because problems in its isolation. (NOTE: No special caution for avoid O<sub>2</sub> in this reaction).

#### - General Procedure A5: Tosyl Amines

**Synthesis of S2.** To a solution of the corresponding tosyl amine (1.0 equiv) in dry NMP (Aldrich SureSeal™, 1.5 M), a 1.0 M solution of potassium hexamethyldisilazide in THF (1.1 equiv) was added at 0°C under inert atmosphere. The reaction was quenched with water (50 mL), and extracted with AcOEt (3 x 30 mL). The combined organic layers were washed with satd NaCl soln three times, dried (Na<sub>2</sub>SO<sub>4</sub>), and the volatiles were removed under reduced pressure. (NOTE: This hydrazide is unstable and cannot be stored. It must be used immediately for the next step). Then, methyl pyruvate (2.00 eq.), anthranilic acid (0.50 eq.) and acetic acid (2.00 eq.) were added to a solution of the previous crude mixture in MeOH (0.2 M), and the mixture was stirred 18 h at room temperature. Upon completion, the reaction mixture was concentrated under reduced pressure, and washed with water. The crude mixture was subjected to purification by flash column chromatography (5-10 % AcOEt in heptane) to obtain the corresponding oxime ester. Then, this ester was dissolved in mixture of methanol/H<sub>2</sub>O (0.2 M, 3:1), and LiOH (3.0 equiv) was added. (NOTE: No special caution for avoid O<sub>2</sub> in this reaction).

#### 3.8.2 Gram Scale Synthesis of **2a**

**Figure S2.** Gram scale synthesis reaction setup of **2a**.

To a 100mL round bottom flask equipped with a magnetic stir bar was added dioxime **1** (1.0 g, 2.41 mmol, 1.0 equiv) and 5BzCN (22 mg, 24.12  $\mu$ mol, 1 mol%). The flask was sealed with a rubber septum, evacuated, and back-filled with nitrogen. After this process was repeated 3 times, anhyd degassed acetone (24.0 mL, c = 0.1 M) was added via syringe. The reaction mixture was transferred to a 25 mL syringe and connected to our homemade flow system. The mixture was pumped through a PFA HPLC tube (total volume of the system: 1.36 mL), and irradiated with two Kessil PR160-blue LED lamp (30 W High Luminous DEX 2100 LED,  $\lambda_{\text{max}} = 427$  nm) for 4 h 24 min (residence time: 15 min, flow rate: 91  $\mu$ L/min) as described in figure S2. The lamps were placed 2 cm away from the reaction system, and cooled at room temperature by an external fan. Upon completion, the volatiles were removed under reduced pressure, and the crude mixture was subjected to purification by flash column chromatography (10-15% AcOEt in heptane). ## 4 Mechanistic Investigations

### 4.1 UV/vis studies

UV/vis absorption spectra were measured in a 1 cm quartz cuvette using JASCO V-660 UV/vis spectrophotometer. Absorption spectra of **1a** (2 mM) and 5CzBN (0.1 mM) were recorded in acetone.

**Figure S3.** UV-vis absorption spectra of **1a** and 5CzBN.

#### 4.2 Quantum yield

The quantum yield of the reaction was determined using the procedure reported previously:<sup>9-10</sup> bifunctional dioxime **1a** was used as a model substrate to calculate the quantum yield, using trimethoxybenzene as internal standard in a proportion 1:1 with **1a**.

The quantum yield of the reaction is defined as:

$$\Phi = \frac{\text{mol of product formed}}{\text{mol of photon flux} \times t \times f} \quad (1)$$

where  $\Phi$  is the quantum yield of the reaction,  $t$  is the time of the reaction (s),  $f$  is the incident light absorbed by the organophotocatalyst at 427 nm and the photon flux is calculated by standard ferrioxalate actinometry<sup>11</sup> (section C).

##### A) Incident light absorbed by 5CzBn ( $f$ )

The fraction of light,  $f$ , absorbed was determined according to *equation 2*:

$$f = 1 - 10^{-A} \quad (2)$$

where A is the absorbance of the fully soluble 5CzBn in acetone at 427 nm. The absorbance of the organophotocatalyst was measured by adding a solution of 5CzBn (0.9 mg, 0.001 mmol) in acetone (1 mL) to a quartz cuvette equipped with a Teflon cap. The absorbance of the solution was recorded, and the absorbance value at 427 nm was determined to be 2.16507 (*figure S4*), indicating the fraction of light absorbed is 0.99316 according to equation 2.

**Figure S4.** Absorption spectrum of 5CzBn in acetone.

### B) The photoredox reaction

The photoinduced transformation was performed as described in *General Procedure C*. Afterwards, 1,3,5-trimethoxybenzene was added as internal standard, and the volatiles were removed under vacuum. The yield of the reaction was determined by  $^1\text{H}$  NMR, where 6.5  $\mu\text{mols}$  (13%) of the desired compound were detected after 300 s.

**Figure S5.** Crude mixture with 1,3,5-trimethoxybenzene after 5 min of irradiation at 427 nm.

### C) Photon flux at 406 nm.

Standard ferrioxalate actinometry was used to determine the photon flux of the spectrophotometer using equations 3 and 4.<sup>9-11</sup> For the ferrioxalate actinometer the production of iron(II) ions proceeds by the following reactions:<sup>11</sup>

The moles of  $\text{Fe}^{2+}$  formed are determined spectrophotometrically by development with 1,10-phenanthroline (phen) to form the red  $[\text{Fe}(\text{phen})_3]^{2+}$  moiety ( $\lambda = 510 \text{ nm}$ ).<sup>9-11</sup> The photon flux is defined as:

$$\text{Photon flux} = \frac{\text{mol } (\text{Fe}^{2+})}{\Phi(\text{Fe}^{2+}) \times t \times f} \quad (3)$$

Where  $\Phi$  is the quantum yield for the ferrioxalate actinometer (1.188 at  $\lambda = 406 \text{ nm}$ ),<sup>11</sup>  $t$  is the time (s), and  $f > 0.999$ , and the mol of  $\text{Fe}^{2+}$  are calculated according to equation 4.

$$\text{mol } (\text{Fe}^{2+}) = \frac{V \times \Delta A}{l \times \epsilon} \quad (4)$$

Where  $V$  is the total volume of the solution,  $\Delta A$  is the difference in absorbance between irradiated and non-irradiated solutions,  $l$  is the path length (1.0 cm),  $\epsilon$  is the molar absorptivity at 510 nm ( $11,110 \text{ L mol}^{-1} \text{cm}^{-1}$ ).<sup>11</sup>

#### D) Experimental.

The following solutions were prepared in the dark (flasks were wrapped in aluminum foil) and stored in the dark at room temperature:

- *Ferrioxalate solution (0.15 M)*: Potassium ferrioxalate hydrate (2.21 g) was added to a flask wrapped in aluminum foil containing  $\text{H}_2\text{SO}_4$  (30 mL, 0.05 M). The flask was stirred for complete solvation of the green solid in complete darkness. It is noteworthy that the solution should not be exposed to any incident light.
- *Developer solution*: 1,10-Phenanthroline (50 mg) and sodium acetate (11.25 g) was added to a flask containing  $\text{H}_2\text{SO}_4$  (50 mL, 0.5 M) and sonicated until completely solvated.

*The absorbance of the non-irradiated sample.* The buffered solution of phen (0.35 mL) was added to a ferrioxalate (2.0 mL) in a vial that had been covered with aluminum foil {lights of the laboratory were switched off}. The vial was capped and allowed to rest for 1 h and then transferred to a cuvette. The absorbance of the non-irradiated was measured at 515 nm to be 0.0368 (Figure 6).

*The absorbance of the irradiated sample.* In a glass vial equipped with a stir bar was added the ferrioxalate solution (2.0 mL), and the stirred solution was irradiated for 75.0 s at  $\lambda = 427$  nm. After irradiation, the buffered phen solution (0.35 mL) was added to the cuvette and allowed to rest for 1 h in the dark to allow the ferrous ions to coordinate completely to phen. The absorbance was measured at 515 nm to be 0.33385 (figure S6).

**Figure S6.** Absorption spectra for irradiated and non-irradiated samples of red  $[Fe(phen)_3]^{2+}$ .

*Photon flux sample calculation.* Sample calculation:

$$\text{mol } (Fe^{2+}) = \frac{V \times \Delta A}{l \times \varepsilon} \quad (4)$$

$$\text{mol } (Fe^{2+}) = \frac{0.00235 \text{ L} \times 0.2970}{1.00 \text{ cm} \times 11.110 \text{ Lmol}^{-1} \text{ cm}^{-1}} = 6.3081 \times 10^{-7} \text{ mol}$$

$$\text{Photon flux} = \frac{\text{mol } (Fe^{2+})}{\Phi(Fe^{2+}) \times t \times f} \quad (3)$$

$$\text{Photon flux} = \frac{6.3081 \times 10^{-7} \text{ mol}}{1.188 \times 75.0 \text{ s} \times 1.00} = 7,0797 \times 10^{-9} \text{ einstein s}^{-1}$$

### E) Quantum yield of the reaction.

Therefore, the quantum yield of the reaction is determined to be:

$$\Phi = \frac{\text{mol of product formed}}{\text{mol of photon flux} \times t \times f} \quad (1)$$

$$\Phi = \frac{6.5 \times 10^{-6} \text{ mol}}{7,0797 \times 10^{-9} \text{ einstein s}^{-1} \times 300 \text{ s} \times 0.99316} = 3.09$$

The quantum yield studies indicate that this is most likely a radical-chain process as evidenced by the  $\Phi$  value. In other words, the quantum yield value indicated that 3 equivalents of product are formed for every photon absorbed. However, due to the low value, it is impossible to exclude a combination of radical chain and catalytic cycle mechanism.

### 4.3 TEMPO trapping experiment

To test the intermediacy of radical species, a trapping experiment was performed using TEMPO [(2,2,6,6-tetramethylpiperidin-1-yl)oxyl] as a radical scavenger. The reaction was performed according to the *General Procedure C* using **1a** (42 mg, 0.1 mmol, 1 equiv) in the presence of TEMPO (78 mg, 0.50 mmol, 5.0 equiv). After chromatographic purification (5-20% AcOEt in heptane), the starting **1a** was recovered in 97% yield (40 mg, 0.97 mmol).

### 4.4 Direct excitation

To an 8 mL vial equipped with a magnetic stir bar was added the bifunctional reagent **1a** (0.20 mmol, 1.0 equiv). The vial was sealed with a cap containing a Sil/PTFE septum, evacuated, and back-filled with nitrogen. After this process was repeated 3 times, anhydrous degassed acetone (2.0 mL,  $c = 0.1$  M) was added via syringe. The reaction mixture was irradiated with a Kessil PR160-blue LED lamp (30 W High Luminous DEX 2100 LED,  $\lambda_{\max} = 427$  nm) for 2 h as described in the “Workflow” section. The lamp was placed 4 cm away from the reaction vials, and cooled at room temperature by an external fan. Upon completion, the volatiles were removed under reduced pressure, and the crude mixture was subjected to purification by column chromatography (10-15% AcOEt in heptane) to afford compound **2** as a yellow oil (20 mg, 0.06 mmol, 30%).  
**<sup>1</sup>H NMR** (300 MHz, CDCl<sub>3</sub>),  $\delta$  (ppm) = 7.70 – 7.61 (m, 2H), 7.43 – 7.27 (m, 8H), 7.26 – 7.15 (m, 3H), 7.06 – 6.99 (m, 2H), 4.43 (dd,  $J = 7.4, 4.8$  Hz, 1H), 3.63 – 3.52 (m, 2H), 2.41 (bs, 1H), 2.08 – 1.97 (m, 1H), 1.92 – 1.81 (m, 1H), 1.61 – 1.43 (m, 2H). **<sup>13</sup>C NMR** (75 MHz, CDCl<sub>3</sub>),  $\delta$  (ppm) = 167.9, 144.8, 139.8, 137.1, 130.2, 128.8 (2C), 128.5 (3C), 128.4 (2C), 128.3 (2C), 127.8 (2C), 127.2 (2C), 126.8, 66.0, 63.1, 36.2, 29.4. **HRMS (ESI)** calcd for C<sub>23</sub>H<sub>24</sub>NO [M+H]<sup>+</sup>: 330.1852, found 330.1854.

#### 4.5 Light ON / OFF experiment

The reaction was performed under standard conditions using **1a** as model substrate. Each 5 min, an aliquot was analyzed by  $^1\text{H}$  NMR using trimethoxybenzene as internal standard. The data was plotted resulting in the following graphic:

**Figure S7.** Light ON/OFF experiment.
