## 1. General Information

Unless otherwise noted, all reagents and solvents were purchased from the commercial sources (from Adamas-beta) and used as received. Thin layer chromatography (TLC) was used to monitor the reaction on Merck 60 F254 precoated silica gel plate (0.2 mm thickness). TLC spots were visualized by UV-light irradiation on Spectroline Model ENF-24061/F 254 nm. The products were purified by flash column chromatography (200-300 mesh silica gel) eluted with the gradient of petroleum ether and ethyl acetate. Proton nuclear magnetic resonance spectra (<sup>1</sup>H NMR) were recorded on a Bruker 500 MHz or 400 MHz NMR spectrometer (CDCl<sub>3</sub>). The chemical shifts were reported in parts per million (ppm), downfield from SiMe<sub>4</sub> ( $\delta$  0.0) and relative to the signal of chloroform-*d* ( $\delta$  7.26, singlet). Multiplicities were afforded as: s (singlet); d (doublet); t (triplet); q (quartet); dd (doublets of doublet) or m (multiplets). The number of protons for a given resonance is indicated by nH. Coupling constants were reported as a *J* value in Hz. Carbon nuclear magnetic resonance spectra (<sup>13</sup>C NMR) was referenced to the appropriate residual solvent peak. Conventional heating was performed with a standard hot plate/magnetic stirrer, using a silicone oil bath. The type of the device that used for the crystal measurement was “X calibur, Eos, Gemini”. High resolution mass spectral analysis (HRMS) was performed on Waters XEVO G2 Q-TOF. 3-Phenylisoxazol-5-amine and N-ethyl-3-phenylisoxazol-5-amine were prepared according to literature.<sup>1</sup>

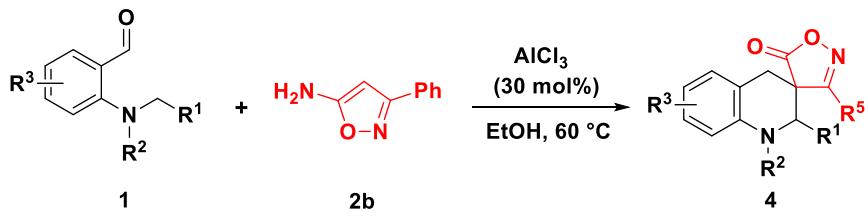

## 2. General Procedure

The mixture was stirred at 80 °C in oil bath. Upon completion of the reaction as indicated by TLC analysis, the mixture was concentrated in vacuum and the residue was directly purified by flash column chromatography on silica gel (petroleum ether: EtOAc = 10:1) to afford the desired **3a-l**.

### 2.2 General Procedure for Construction of 4

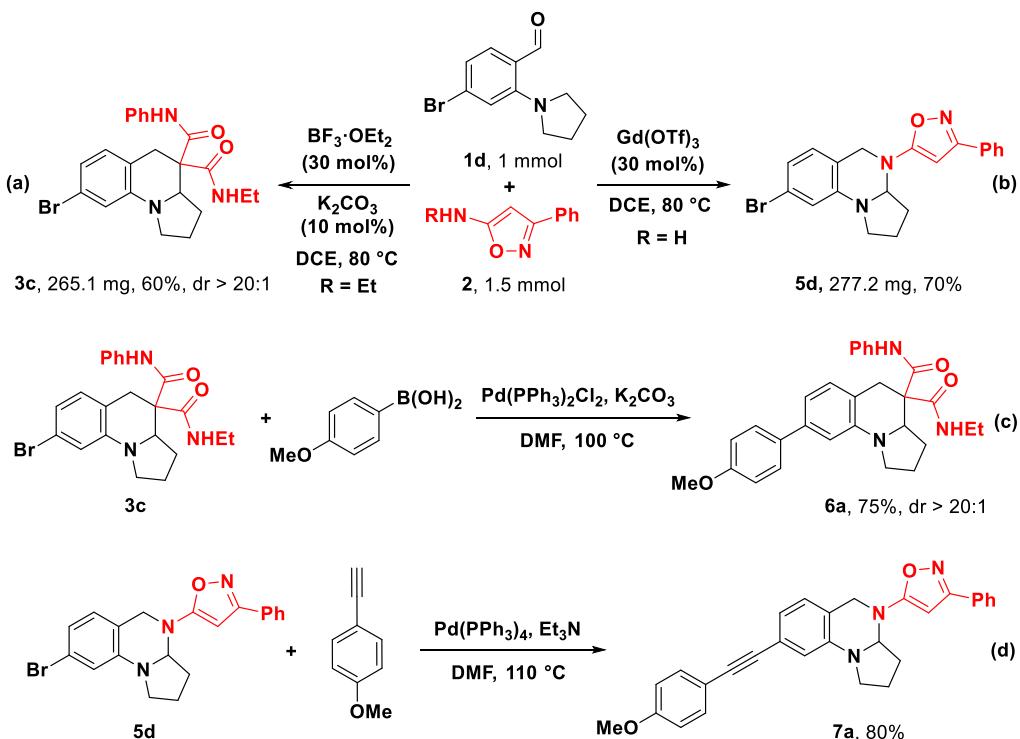

A sealed tube was charged **1** (0.1 mmol, 1.0 equiv.), **2b** (0.15 mmol, 1.5 equiv.), AlCl<sub>3</sub> (30 mol%, 0.3 equiv.), and EtOH (1.0 mL). The mixture was stirred at 60 °C in oil bath. $\text{Pd}(\text{PPh}_3)_2\text{Cl}_2$  (2.1 mg, 0.003 mmol) and  $\text{K}_2\text{CO}_3$  (14 mg, 0.1 mmol) were degassed in a flame-dried round-bottom flask, and then 4-methoxyphenylboronic acid (45 mg, 0.3 mmol), and compound **3c** (39.7 mg, 0.1 mmol). Then, DMF (2.0 mL) were added to the mixture under  $\text{N}_2$ . The reaction mixture was heated at 100 °C for 4h and then allowed to cool to room temperature. The black solution was washed with water (3 x 10 mL) and extracted with  $\text{CH}_2\text{Cl}_2$  (2 x 10 mL). All organic phases were combined, dried over sodium sulfate, filtered and concentrated in vacuo to obtain the crude product. The residue was purified by flash column chromatography on silica gel (petroleum ether: EtOAc = 10:1) to afford **6a** (35.2 mg, 0.075 mmol, 75%).
