

Molecular Docking Molecular Dynamics Simulation Studies

For molecular docking studies BioSolveIT's LeadIT software was used www.biosolveit.de/LeadIT. For visualization of docked conformations, Desmond Molecular Dynamics (D.E. Shaw Research) on Schrödinger Maestro 2023.4 software was opted to perform Molecular Dynamic Simulations study¹. In Molecular Dynamics Simulations the complex of **5d** with hDHFR was first prepared with Protein Preparation Workflow by options opting for replacing hydrogens, assigning bond orders, using CCD database, creating zero-order bonds to metals and disulfide bonds, and deleting waters beyond 0 Å from het groups. In the refine tab, sample water orientations, use PROPKA pH 7.4 option was opted and the structure was optimized. In system builder panel, TIP3P solvent model was used for solvation in the orthorhombic box using buffer settings with 10 Å x 10 Å x 10 Å and minimized volume option was used, then Ions placement (default-recalculated) with salt addition (0.15M NaCl) was carried out. Complex of **5d** with hDHFR after solvation resulted in 23599 atoms. In molecular dynamics panel, 100ns (nanoseconds) simulation time was entered, while recording interval was set to 100ps (picoseconds), with energy option at 1.2, it resulted in approximation for 1000 frames. For final run, NPT ensemble class was opted at 300.0 Kelvin with Nosé-Hoover chain temperature coupling and 1.01325 bar pressure with Martyna-Tobias-Klein pressure coupling. The system followed the default relaxation protocol before the simulation, which included small simulations, using NVT and NPT ensembles with different restraints parameters.
