Figure SI-4. In the equal concentration experiments (A), the uptake of REEs by the crystallising carbonate occurs in the same ratio as their composition in the aqueous solution, indicating that the crystallising carbonate mirrors the REE composition of the surrounding solution. Conversely, in the PAAS solution experiments (B), the REE ratio is different compared to the equal concentration, but still reflects the higher concentration of La, Ce and Nd in the original solution.

Figure SI-5. Powder XRD patterns of goethite (G) in the equal concentration (non-PAAS) and PAAS experiments at 50 °C after 24 hours and 8 weeks (*Bragg peaks that have not been assigned to any phase correspond to siderite). The diagram in the bottom area shows the standard XRD patterns of the phases found in these experiments.

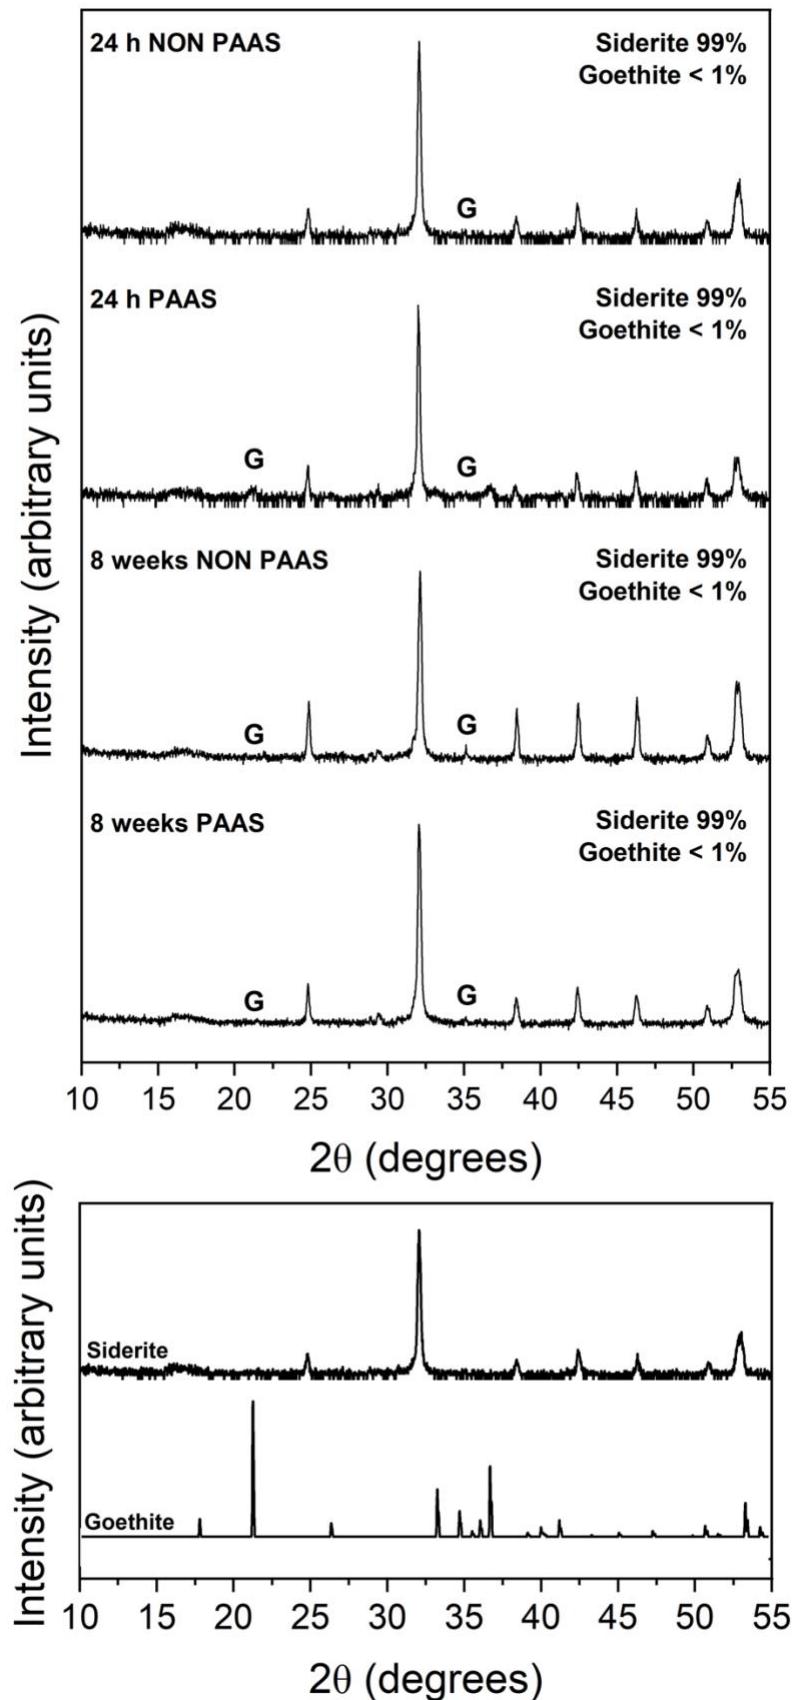

Figure SI-6. Powder XRD patterns of goethite (G), hematite (H), kozote (K), hydroxylbastnasite (B) and cerianite (C) in the equal concentration (non-PAAS) and PAAS experiments at 165 °C after 24 hours and 2 weeks (*Bragg peaks that have not been assigned to any phase correspond to siderite) The diagram in the right area shows the standard XRD patterns of the phases found in these experiments.

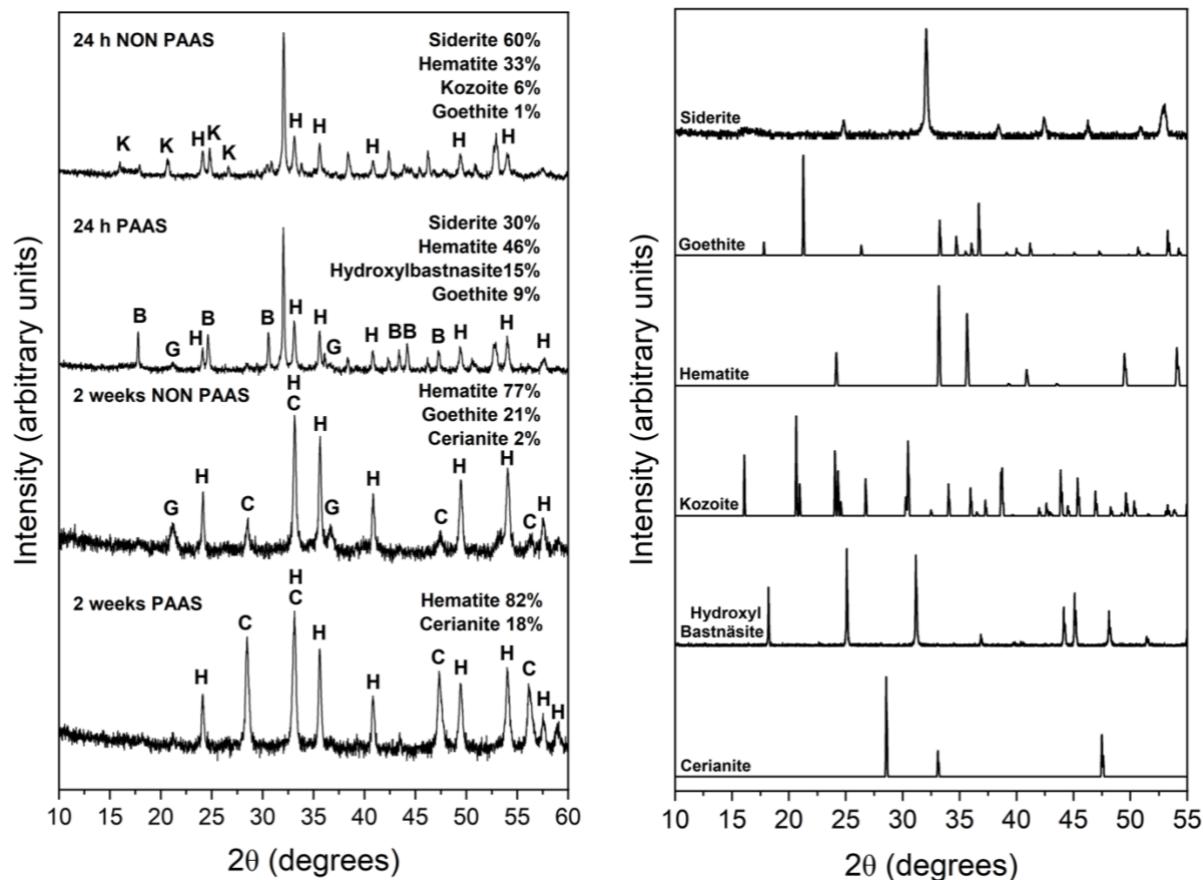

Figure SI-7. Powder XRD patterns of, hematite (H), hydroxylbastnasite (B) and cerianite (C) in the equal concentration (non-PAAS) and PAAS experiments at 205 °C after 24 hours (*Bragg peaks that have not been assigned to any phase correspond to siderite). The diagram in the bottom area shows the standard XRD patterns of the phases found in these experiments.
