Table S1: Performance of all four catalysts in this report

Compound	Overpotential at 10mA/cm <sup>2</sup> (mV)	Tafel Slope (mV.dec <sup>-1</sup> )
GaCo <sub>2</sub> O <sub>4</sub>	270	79
Co <sub>3</sub> O <sub>4</sub>	170	65
Co <sub>2.5</sub> Ga <sub>0.5</sub> O <sub>4</sub>	220	56
Co <sub>1.7</sub> Al <sub>1.3</sub> O <sub>4</sub>	193	77

Table S2: Compositional ratios of all elements of all materials explored in this report based on the ratios of the areas of peaks corresponding to  $\text{Co}^{2+}$  and  $\text{Co}^{3+}$ . Data obtained from XPS

Assumed Composition	$\text{Co}^{2+}$ ratio	$\text{Co}^{3+}$ ratio	True Composition
$\text{Co}_3\text{O}_4$	1	2	$\text{Co}_3\text{O}_4$
$\text{Co}_{2.5}\text{Ga}_{0.5}\text{O}_4$	1	1.5	$\text{Co}_{2.5}\text{Ga}_{0.5}\text{O}_4$
$\text{Co}_{1.5}\text{Ga}_{1.5}\text{O}_4$	1	1	$\text{GaCo}_2\text{O}_4$
$\text{Co}_{1.5}\text{Al}_{1.5}\text{O}_4$	0.7	1	$\text{Co}_{1.7}\text{Al}_{1.3}\text{O}_4$

Table S3: Double layer capacitance and ECSA of each catalyst studied in this report. The specific capacitance used to determine the ECSA is 0.04 mF

Catalyst	Capacitance (mF)	ECSA
$\text{Co}_3\text{O}_4$	282	7050
$\text{Co}_{2.5}\text{Ga}_{0.5}\text{O}_4$	163	4075
$\text{Co}_{1.5}\text{Al}_{1.5}\text{O}_4$	265	6625
$\text{Co}_{1.5}\text{Ga}_{1.5}\text{O}_4$	121	3025

Table S4: U values used for all DFT calculations on this report. All U values are taken from Ref. 13

Element	U-value
Sc	3.0
Ti	3.9
V	3.5
Cr	3.5
Mn <sup>2+</sup>	5.25
Mn <sup>3+</sup>	4.0
Fe <sup>2+</sup>	4.0
Fe <sup>3+</sup>	4.0
Co <sup>2+</sup>	4.5
Co <sup>3+</sup>	3.3
Ni <sup>2+</sup>	6.0
Ni <sup>3+</sup>	6.4
Cu	6.0
Zn	4.7

Catalyst (1M KOH)	Overpotential at 10mA/cm <sup>2</sup> (mV)	Tafel Slope (mV.dec)	Reference
Co <sub>2.5</sub> Ga <sub>0.5</sub> O <sub>4</sub>	220	56	This work
GaCo <sub>2</sub> O <sub>4</sub>	270	79	This work
Co <sub>3</sub> O <sub>4</sub>	170	65	This work
Co <sub>1.7</sub> Al <sub>1.3</sub> O <sub>4</sub>	193	77	This work
Ni-Fe Boride	167	25	45
Amorphous NiFe	265	25	41
NiFe LDH/NiFeS <sub>x</sub>	210	31	40
NiFe-OOH/Ni foam	250	36	52
Amorphous LaNiFe-OH	189	36	42
NiFe-LDH/NiCu	218	56.9	49
NiFe-LDH	195	40.3	50
Au/NiFe-LDH	237	36	54
Ni-Fe-O nanowires	244	39	48
NiFeSe/Ni foam	198	54	52
NiMoFe/Ni foam	257	53	52
NiFe-LDH/NiCoP	220	48.6	44
FeCoW/Ni foam	210	53	52
CoV-OOH/Ni foam	268	56	52

Figure S1: Periodic table of elements. The elements circled in black represent (apart from Tc) the elements examined this report. All the alkali, alkali earth, transition and post-transition metal elements were examined in this report. Some lanthanides (La,Ce,Nd, Gd and Lu) were also included as well, however, not all lanthanide elements could be included because the number of permutations of compounds would get unmanageably large.

B)

$$\Delta G_1 = \Delta G_{O^*} - \Delta G_{OH^*} + k_B T \ln a_{OH} - eU$$

$$\Delta G_2 = \Delta G_{OOH^*} - \Delta G_{O^*} + k_B T \ln a_{OH} - eU$$

$$\Delta G_3 = \Delta G_{O_2} - \Delta G_{OOH^*} + k_B T \ln a_{OH} - eU$$

$$\Delta G_4 = \Delta G_{OH^*} - \Delta G_{H_2O(l)} + k_B T \ln a_{OH} - eU$$

Figure S12: a) The four-step AEM mechanism of water oxidation b) Free energy calculations of each step outlined in a) based on the computational hydrogen electrode model.  $\Delta G_{O^*}$ ,  $\Delta G_{OH^*}$ ,  $\Delta G_{OOH^*}$  and  $\Delta G_{H_2O}$  refer to the binding energies of  $O^*$ ,  $OH^*$ ,  $OOH^*$  and  $H_2O^*$  on the surface of the material.  $k_B$  refers to the Boltzmann constant,  $T$  refers to the temperature,  $a_{OH}$  refers to the concentration of  $OH^-$  ions,  $e$  is the charge of an electron in eV and  $U$  refers to the applied potential. Calculations are performed with the assumption that  $a_{OH} = 1M$  and  $U = 0V$ .

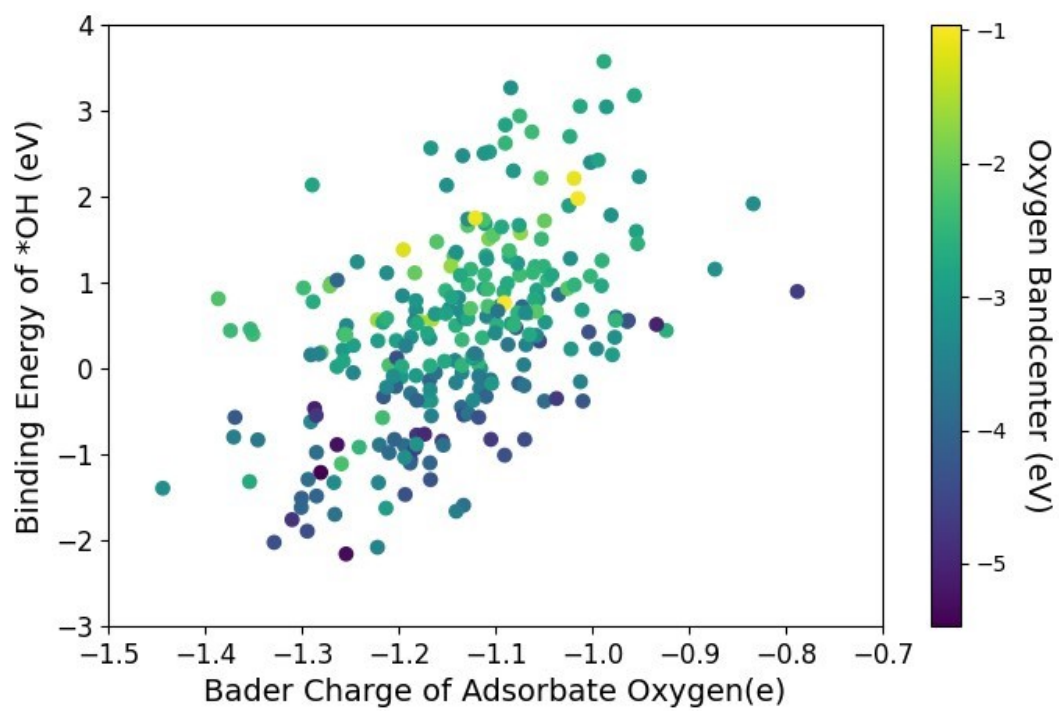

Figure S13: Bader charge of the adsorbate oxygen is plotted against the binding energy of the \*OH intermediate. The colorbar represents the O2p bandcenter of adsorbate oxygen

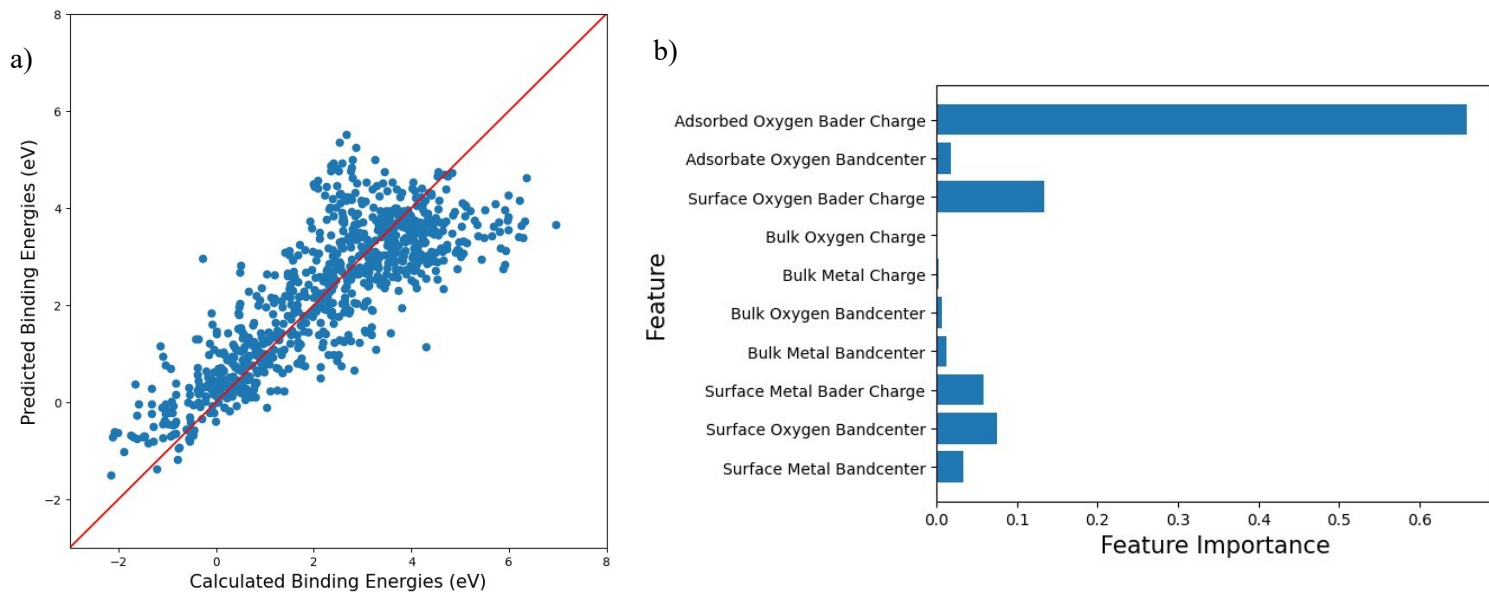

Figure S14: LASSO Regression of binding energies of \*O, \*OH and \*OOH intermediates using the same eight calculated features. LASSO performs a lot more poorly than the random-forest model at predicting the energy of the \*O, \*OH and \*OOH intermediates; with an  $R^2$  value of 0.65 for the training set and an  $R^2$  value of 0.72 for the test set. A) A graph to compare the predicted binding energies of the LASSO model with the calculated ones. The median absolute error is 0.56 eV for both the training and test sets. B) A bar graph that denotes the relative importance of the features that were inputs into the model. Just like in the random-forest model, the Bader charge of adsorbed oxygen was the single most important factor predicting the binding energies of the intermediates.
