Details of adsorption energy calculation:

Based on the theory of Nørskov et al., we calculate the binding energy of the metal active center of diatomic catalyst adsorbing intermediates *CO, *COOH and *HCOO with the following equation:¹

$$E_b(\text{CO}) = E(*\text{CO}) + \Delta E_{\text{sol}}(\text{CO}) - E^* - E(\text{CO(g)})$$

$$E_b(\text{COOH}) = E(*\text{COOH}) + \Delta E_{\text{sol}}(\text{COOH}) - E^* - E(\text{CO}_2\text{(g)}) - 1/2E(\text{H}_2)$$

$$E_b(\text{CHO}) = E(*\text{CHO}) + \Delta E_{\text{sol}}(\text{CHO}) - E^* - E(\text{CO(g)}) - 1/2E(\text{H}_2)$$

$E_b(\text{CO})$, $E_b(\text{COOH})$, and $E_b(\text{CHO})$ are the binding energies of *CO, *COOH, and *CHO, respectively. The ΔE_{sol} indicates a solvation correction to binding energy. For *CO, *COOH, and *CHO, the solvation correction is -0.1 eV, -0.25 eV and -0.1 eV, respectively.

where ΔE_{sol} represents the solvation correction. Here we considered constant solvation correction, which was assigned as -0.1 eV and -0.25 eV for *CO and *COOH, respectively.

Table S2. Computed formation energy (E_f) and dissolution potential (U_{diss}) of dual-metals, and N_e are the standard dissolution potential of bulk metal and the number of transferred electrons involved in the dissolution, respectively. The electrochemically unstable systems are depicted by red color. $N_e = [N_e(TM1) + N_e(TM2)]/2$, $= /2$.
