Compound 1,3,6,8-tetrabromopyrene² and 1,2-bis(4-(*tert*-octyl)phenyl)ethyne³ were prepared according a literature procedures.

Synthesis of Compound 1 In a sealed tube, a solution of 1,3,6,8-tetrabromopyrene (50 mg, 0.097 mmol), 1,2-bis(4-(*tert*-octyl)phenyl)ethyne (156 mg, 0.386 mmol), Pd₂(dba)₃ (35.5 mg, 0.0386 mmol), P(o-Tol)₃ (17.7 mg, 0.0582 mmol), KOAc (93mg, 0.97 mmol), LiCl (16.45 mg, 0.388 mmol) and NMP (5 ml) was degassed with nitrogen for 3 times and then stirred at 130 °C for 36 h. After cooling the mixture was to room temperature, the mixture was diluted with dichloromethane and washed with water, and dried over anhydrous sodium sulfate. The organic layer was evaporated and the solid was washed with acetone. The crude product was further purified by short column chromatography on silica gel eluted with dichloromethane and washed with acetone. The product **1** was obtained as yellow solid (35 mg, 20%).

2. UV, CV and CD Spectra of Compounds

UV-vis absorption spectra were measured with Shimadzu (UV-3600i Plus) in CHCl_3 at room temperature; Circular dichroism (CD) measurements were carried out on a J-815-150S Spectrometer in CHCl_3 at room temperature. Cyclic voltammetry (CV) was recorded on a CHI620E electrochemical workstation using glassy carbon discs as the working electrode, Pt wire as the counter electrode, Ag/Ag^+ electrode as the reference electrode, and ferrocene/ferrocenium as an internal potential marker. The experiments were performed in nitrogen-purged DCM with tetrabutylammonium hexafluorophosphate (TBAPF₆, 0.1 M) as the supporting electrolyte with a scan of 100 mV/s.

4. Density Functional Theory Results

All density functional theory (DFT) calculations were performed using Gaussian 09, Revision D.01 program.⁴ All optimized structures were conducted at the B₃LYP level with the 6-311G(d,p) basis set at gas phase, the same level of frequency analysis confirmed that all optimized structures were energy minima structures on the potential energy surface. Time-dependent density functional theory (TD-DFT) and were calculated at the B₃LYP/6-311G(d,p) level in CHCl₃, with the IEFPCM solvent model and at least the 100 excited states were considered. For better comparison with experimental data, Lorentz broadening with a half width at half height of 0.3 eV was applied to obtain the line spectra. CD spectra and Major orbital transition contributions in excited states were generated using Multiwfn 3.8 software.⁵ Independent gradient model based on Hirshfeld partition (IGMH) method⁶ was performed in Multiwfn and the visual isosurface images were obtained by VMD.⁷ NICS values were calculated at the B₃LYP/6-311G(d,p) using the standard GIAO procedure;⁸ ACID plot was calculated by using the method developed by Herges based on the optimized ground-state geometries.⁹ The optimization and frequency calculations of the transition states (TS) were conducted at the B₃LYP/6-311G(d,p) level at gas phase and only one imaginary frequency exists. The connection between the transition states and the ground state was confirmed by IRC calculation.

6. Binding Behaviors

The association behaviors of z_{meso} and guest were analyzed by NMR titrations. A deuterium solution of z_{meso} (4.0×10^{-4} M) and a solution of guest (4.0×10^{-4} M) were prepared. The solutions were mixed with different ratios.

A solution of z_{meso} at a concentration of approximately. Those solutions were utilized as solvents in the guest solution, to ensure working at constant concentration of host. The concentration $[\mathbf{z}_{\text{meso}}]$ was kept to be $2.0 \times 10^{-4} \text{ M}$ for all entries and the concentration $[\text{C}_{70}]$ was changed from 0.0 to $5.0 \times 10^{-4} \text{ M}$. (400MHz, toluene- d_8 , 298 K).

7. X-ray Crystallographic Data for Compounds

Single crystals of **1** suitable for X-ray diffraction analysis were grown by slow diffusion of methanol into chloroform solution at room temperature, **2_{meso}** was grown by slow diffusion of chlorobenzene into methanol solution at room temperature, **2_{rac}** was grown by slow diffusion of toluene into methanol solution at room temperature. The X-ray diffraction data were collected on a MMo07HF Saturn724+ diffractometer with graphite monochromated Cu K α (1.54184 Å) and Mo K α (0.71073 Å). These structures were refined using the SHELXL-2018. Crystallographic data have been deposited with the Cambridge Crystallographic Data Centre as supplementary publication No. CCDC 2353253 (**1**), 2353606 (**2_{meso}**) and 2353623 (**2_{rac}**). The single crystal X-ray crystallographic data were summarized in Table S7. (NOTE: The large Rint value in the checkcif report of **2_{rac}** was due to the weak reflection intensity at higher angles; Due to the weak diffraction of **2_{rac}** crystals, some reflections with large estimated standard deviations were omitted during refinement.)
