[^0]
## 1. Materials and Methods

Anhydrous potassium carbonate, 1,2,4,5-tetrabromobenzene, (4-formyl phenyl) boronic acid, 1,3,6,8-tetrabromopyrene, tetrakis(triphenylphosphine)palladium(0), and silica gel for column chromatography were purchased from commercial sources. All organic solvents such as methanol, tetrahydrofuran (THF), acetone, nitrobenzene, mesitylene, pdioxane, trifluoroacetic acid, and dichloromethane (DCM) were analytical grade reagents used without further purification.

## 2. Characterization

FTIR spectra were collected on a Bruker Tensor 27 FTIR spectrophotometer with a resolution of $4 \mathrm{~cm}^{-1}$ by using the KBr disk method. ${ }^{13} \mathrm{C}$ nuclear magnetic resonance (NMR) spectra were examined using an INOVA 500 instrument with DMSO and $\mathrm{CDCl}_{3}$ as the solvent and TMS as the external standard. Chemical shifts are reported in parts per million ( ppm ). The thermal stabilities of the samples were performed by using a TG Q-50 thermogravimetric analyzer under an $\mathrm{N}_{2}$ atmosphere; the cured sample (ca. 5 mg ) was put in a Pt a cell with a heating rate of $20^{\circ} \mathrm{C} \mathrm{min}^{-1}$ from 100 to $800^{\circ} \mathrm{C}$ under an $\mathrm{N}_{2}$ flow rate of $60 \mathrm{~mL} \mathrm{~min}{ }^{-1}$. Wide-angle X-ray diffraction (WAXD) patterns were measured by the wiggler beamline BL17A1 of the National Synchrotron Radiation Research Center (NSRRC), Taiwan. The morphologies of the polymer samples were examined by Field emission scanning electron microscopy (FE-SEM; JEOL JSM7610F) and by transmission electron microscope (TEM) using the JEOL-2100 instrument at an accelerating voltage of 200 kV . BET surface area and porosimetry measurements of samples (ca. $40-100 \mathrm{mg}$ ) were measured using BEL Master ${ }^{\mathrm{TM}} / \mathrm{BEL} \operatorname{sim}^{\mathrm{TM}}$ (v. 3.0.0). $\mathrm{N}_{2}$ adsorption and desorption isotherms were generated through incremental exposure to ultrahigh-purity $\mathrm{N}_{2}$ (up to ca. 1 atm) in a liquid $\mathrm{N}_{2}(77 \mathrm{~K})$ bath. Surface parameters were calculated using BET adsorption models in the instrument's software. The prepared samples' pore size was determined using nonlocal density functional theory (NLDFT). We recorded the photoluminescence (PL) conductance of the COF-based imide-imine linkage from the fluorescence emission spectra of their corresponding solutions via Hitachi 11 F-7000 spectrophotometer equipped with a

Xenon lamp ( $\lambda=250 \sim 800 \mathrm{~nm}$ ), We dissolved these COFs in N-methyl pyrrolidine at 1 $\mathrm{mg} \mathrm{mL}^{-1}$, as the limiting concentration, followed by excitation with light at 350 nm . Ultraviolet/visible diffuse reflectance spectroscopy (UV-Vis DRS) of synthesized COPs were detected via a Hitachi U-3300 spectrophotometer. Electrochemical Impedance Spectroscopy (EIS) was performed on a Zahner Zennium E workstation equipped with a three-electrode cell including a Pt wire counter electrode, $\mathrm{Ag} / \mathrm{AgCl}$ as reference electrode $(3 \mathrm{M} \mathrm{NaCl})$, and a fluorine-doped tin oxide (FTO) glass as working electrode. About 5 mg of COFs were dispersed into an acetonitrile solution ( 1 mL ) with $30 \mu \mathrm{~L}$ Nifion and sonicate for 1 h . After that, $200 \mu \mathrm{~L}$ of as-prepared suspension was spin-coated on FTO glass with an active area of $6.875 \mathrm{~cm}^{2}$. Here, $0.5 \mathrm{M} \mathrm{Na}_{2} \mathrm{SO}_{4}$ aqueous solution was prepared as an electrolyte. 1.5 V constant potential was applied under LED light irradiation ( $300 \mathrm{~W} / \mathrm{cm}^{2}$ ). The COF photocatalysts time-resolved photoluminescence (TRPL) spectra were measured on a spectrometer (FLS980, Edinburgh Instruments) with a gated photomultiplier tube. The energy levels of the HOMO were measured using a photoelectron spectrometer (model AC-2). The energy levels of the LUMOs were calculated by subtracting the Eg from the HOMO energy levels.

## 3. Synthetic Procedures of Monomers

Scheme S1: 1,2,4,5-Tetrakis-(4-formylphenyl)benzene (TFPB-4CHO).

TFPB-4CHO was prepared according to the reported method with some modifications ${ }^{1}$. We added 1,2,4,5-Tetrabromobenzene ( $1.5 \mathrm{~g}, 3.033 \mathrm{mmol}$ ), 4-formylphenylboronic acid $(3.638 \mathrm{~g}, 24.264 \mathrm{mmol})$, palladium tetrakis(triphenylphosphine) ( $0.175 \mathrm{~g}, 0.15 \mathrm{mmol}, 5$ $\mathrm{mol} \%$ ), and anhydrous potassium carbonate $(6.716 \mathrm{~g}, 48.520 \mathrm{mmol}$ ) in $p$-Dioxane ( 50 mL ) in the sealed tube $(250 \mathrm{~mL})$ and then degassed under argon for 20 minutes and heated the mixture for 72 h at $120^{\circ} \mathrm{C}$. The suspension reaction mixture was poured into slurry ice containing 60 mL of concentrated hydrochloric acid to neutralize the excess potassium carbonate. The solid product was filtered and washed thrice with water and 2 M HCl . The crude product was purified using short-column chromatography with dichloromethane as eluent. The DCM was evaporated under reduced pressure to obtain the final product as a yellowish powder ( $1.7 \mathrm{~g}, 90.4 \%$ ). FTIR ( $\mathrm{KBr}, \mathrm{cm}^{-1} ; 3038$ ( CH aromatic), 2827, 2740 $(\mathrm{HC}=\mathrm{O}), 1699(\mathrm{C}=\mathrm{O}), 1606$ and $1576(\mathrm{C}=\mathrm{C})$ (Figure 2a); ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ $9.98(\mathrm{~s}, 4 \mathrm{H}, \mathrm{CHO}), 7.77(\mathrm{~d}, \mathrm{~J}=8.1 \mathrm{~Hz}, 8 \mathrm{H}), 7.58(\mathrm{~s}, 2 \mathrm{H}), 7.37(\mathrm{~d}, \mathrm{~J}=8.1 \mathrm{~Hz}, 8 \mathrm{H})$ (Figure S1); ${ }^{13} \mathrm{C}$ NMR (126 MHz, $\mathrm{CDCl}_{3}$ ) $\delta$ 191.64, 146.07, 139.72, 135.32, 132.82, 130.43, 12 9.70 (Figure S2); Anal. Calcd for $\mathrm{C}_{34} \mathrm{H}_{22} \mathrm{O}_{4}$ : C, 82.58; H, 4.48; O, 12.94\%. Found: C, 82.40; H, 4.42; O, 12.97\%.

Scheme S2: Synthesis of 1,3,6,8-Tetra(4-formylphenyl)pyrene (PyTP-4CHO).
PyTP-4CHO was prepared according to the reported method with some modifications ${ }^{2}$. A mixture of $\mathrm{Py}-4 \mathrm{Br}(0.54 \mathrm{~g}, 1.1 \mathrm{mmol}), \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(0.06 \mathrm{~g}, 0.05 \mathrm{mmol})$, $4-$ formylphenylboronic acid ( $0.98 \mathrm{~g}, 6.53 \mathrm{mmol}$ ), and $\mathrm{K}_{2} \mathrm{CO}_{3}(2.30 \mathrm{~g}, 16.64 \mathrm{mmol})$ was degassed under vacuum. Dioxane ( 50 mL ) was added, and then the mixture was heated at $85^{\circ} \mathrm{C}$ for three days. The contents were poured onto ice-cold $\mathrm{H}_{2} \mathrm{O}$ and neutralized with $\mathrm{HCl}(2 \mathrm{~mL})$ to dissolve any remaining $\mathrm{K}_{2} \mathrm{CO}_{3}$. The precipitate was filtered off, washed with MeOH , recrystallized from 1,4-dioxane, and dried to produce a yellow powder ( $85 \%$ ). FTIR ( $\mathrm{KBr}, \mathrm{cm}^{-1}, 3041$ (CH aromatic), 2813, 2727 ( $\mathrm{H} \mathbf{C = O}$ ), 1693 (C=O), 1606 (C=C) (Figure 2b). ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 10.14$ (s, 4H, CHO), 8.15 ( $\mathrm{s}, 4 \mathrm{H}$ ), 8.07 (d, J = $8.0 \mathrm{~Hz}, 8 \mathrm{H}$ ), 8.02 (s, 2H), $7.84(\mathrm{~d}, \mathrm{~J}=8.0 \mathrm{~Hz}, 8 \mathrm{H})$ (Figure S3). ${ }^{13} \mathrm{CNMR}$ result of PyTP4 CHO cannot be provided due to its poor solubility; Anal. Calcd for $\mathrm{C}_{44} \mathrm{H}_{26} \mathrm{O}_{4}$ : C, 85.42; H, 4.24; O, 10.34 \%. Found: C, 85.67; H, 4.18; O, 11.02 \%.

Scheme S3: Preparation of Naphthalenediimide diamine ( $\mathrm{DNI}-2 \mathrm{NH}_{2}$ )
DNI- $2 \mathrm{NH}_{2}$ was prepared according to the reported method with some modifications ${ }^{3}$. To a round bottom flask equipped with a stir bar and condenser was added the naphthaleneanhydride ( $750 \mathrm{mg}, 2.8 \mathrm{mmol}$ ) and diaminobenzene ( $3.02 \mathrm{~g}, 28.0 \mathrm{mmol}$ ) under inert conditions. The solids were dissolved in 50 mL of anhydrous DMF. Triethylamine ( $2.6 \mathrm{~mL}, 18.7 \mathrm{mmol}$ ) was added, and the reaction was heated to reflux for 20h. The reaction was cooled, filtered and the resulting mixture was filtered, and the residue was washed with copious amounts of water, acetone and then chloroform. The brownish red solid was isolated pure in a $95 \%$ yield. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz, DMSO- $_{6}$ ) $\delta 8.68$ (s, 4H), $7.00(\mathrm{~d}, J=$ $8.4 \mathrm{~Hz}, 4 \mathrm{H}), 6.65$ (d, $J=8.4 \mathrm{~Hz}, 4 \mathrm{H}), 5.29$ (s, 4H) (Figure S4).

## 4. Synthetic Procedures of COFs

Scheme S4: Synthesis of TFPB-DNII-COF.
A 10 mL heavy-walled sealed tube was filled with 1,2,4,5-Tetrakis-(4formylphenyl)benzene (TFPB-4CHO) ( $11.03 \mathrm{mg}, 0.022 \mathrm{mmol}$ ), Naphthalenediimide diamine $\left(\mathrm{DNI}-2 \mathrm{NH}_{2}\right)(20.00 \mathrm{mg}, 0.044 \mathrm{mmol}), 1.00 \mathrm{~mL}$ of nitrobenzene, and 1.00 mL of mesitylene. The reaction mixture was sonicated for 5 minutes, then $10 \mu \mathrm{~L}$ of trifluoroacetic acid (TFA) was added, followed by another 10 minutes of sonication. The tube was plunged into liquid nitrogen, flash-frozen at 77 K , and evacuated to an internal pressure of 100 mTorr . The reaction was then heated to $120^{\circ} \mathrm{C}$ for 4 days, resulting in the precipitation of COFs. The solid was isolated by filtration and thoroughly washed with acetone, THF, methanol, and ether. Subsequently, it was subjected to overnight Soxhlet extraction with methanol. Finally, the activated TFPB-DNII-COF was obtained by oven vacuum activation at $80^{\circ} \mathrm{C}$ for 8 h .

Scheme S4: Synthesis of Py-DNII-COF.
A 10 mL heavy-walled sealed tube was filled with 1,3,6,8-Tetra(4-formylphenyl)pyrene (PyTP-4CHO) ( $13.79 \mathrm{mg}, 0.022 \mathrm{mmol}$ ), Naphthalenediimide diamine (DNI-2NH2) (20.00 $\mathrm{mg}, 0.044 \mathrm{mmol}), 1.00 \mathrm{~mL}$ of nitrobenzene, and 1.00 mL of mesitylene. The reaction mixture was sonicated for 5 minutes, then $10 \mu \mathrm{~L}$ of trifluoroacetic acid (TFA) was added, followed by another 10 minutes sonication. The tube was plunged into liquid nitrogen, flashfrozen at 77 K , and evacuated to an internal pressure of 100 mTorr . The reaction was then heated to $120^{\circ} \mathrm{C}$ for 4 days, resulting in the precipitation of COFs. The solid was isolated by filtration and thoroughly washed with acetone, THF, methanol, and ether. Subsequently, it was subjected to overnight Soxhlet extraction with methanol. Finally, the activated Py-DNII-COF were obtained by oven vacuum activation at $80^{\circ} \mathrm{C}$ for 8 h .
