Table S2	Comparison table of present work with other analytical techniques.

Materials and reagents: The chemicals employed for the synthesis of dipeptide *i.e.*, benzyl ester of phenylalanine, N-tertbutyloxycarbonyl leucine (N-Boc-Leu), *N, N*-diisopropylethylamine (DIPEA), 1-ethyl-3-(3-dimethylaminopropyl) carbodiimide (EDC), hydroxybenzotriazole (HOBt), 1-fluoro-2-isocyanatobenzene, trifluoroacetic acid (TFA), dichloromethane (DCM) and oleic acid were purchased from TCI Chemical limited. The pesticide solutions were procured from Sigma-Aldrich and their 1 mM solutions were prepared in Milli-Q water. Zinc nitrate hexahydrate $[Zn(NO_3)_2 \cdot 6H_2O]$ was purchased from

Sigma-Aldrich. These chemicals were employed in the studies without any further purification.

Synthesis of DM2: The synthesis of DM2 was carried out in a stepwise manner. Initially, (A) was synthesized by a coupling reaction between the benzyl ester of phenylalanine (1.2 eq.) and *N*-Boc-Leu (1 eq.) at 0-4°C under an inert atmosphere using DIPEA (2.2 eq.) as a base in the presence of coupling agent, EDC (1.2 eq.) and HOBt (1.2 eq.). The reaction was quenched with ice-cold Milli-Q water and concentrated under reduced pressure resulting in pure product (A). It was refluxed in TFA/DCM (20%) to accomplish the deprotection of Boc group leading to the formation of precursor (B). The reaction of precursor (B) with 1-fluoro-2-isocyanatobenzene in acetonitrile at room temperature resulted in the formation of dipeptide *i.e.*, *N*-functionalized naphthyl urea derivative of dipeptide (DM2) as shown in Scheme 1. FT-IR, ¹H-NMR, ¹³C-NMR, and ESI-MS techniques confirmed the formation of *benzyl((2-fluorophenyl) carbamoyl)-L-leucyl-L-phenylalaninate*, DM2 as shown in Fig. S1-S4. The characteristic carbonyl stretching frequency of -CO-NH- moiety of peptide bond appeared at 1638 cm⁻¹ in the FT-IR spectrum of DM2. The ¹H-NMR and ¹³C-NMR established the formation of DM2 and its ESI-MS spectrum displayed an M+1 peak at m/z=506 confirming the formation of dipeptide, DM2.

Characterization data of *Benzy((2-fluorophenyl) carbamoyl)-L-leucyl-L-phenylalaninate*

[DM2]: ¹H-NMR (400 MHz, DMSO-*d*₆) δ 8.54 (d, J = 7.3 Hz, 1H), 8.36 (d, J = 3.1 Hz, 1H), 8.11 – 8.06 (m, 1H), 7.37 – 6.98 (m, 12H), 6.88 (q, J = 7.6 Hz, 1H), 6.79 (d, J = 8.5 Hz, 1H), 5.07 – 4.97 (m, 2H), 4.54 – 4.44 (m, 1H), 4.30 – 4.19 (m, 1H), 3.09 – 2.87 (m, 2H), 1.53 (q, J = 7.6, 6.1 Hz, 1H), 1.41 – 1.18 (m, 2H), 0.81 (d, J = 6.7 Hz, 6H); ¹³C-NMR (DMSO-*d*₆) δ 173.24, 171.71, 154.80, 137.70, 136.25, 129.63, 128.86, 128.73, 128.53, 128.40, 127.01, 124.86, 122.06, 120.53, 115.38, 115.19, 66.54, 54.15, 51.48, 42.61, 36.96, 24.66, 23.53, 22.42; **ESI-MS:** (TOF MS ES⁺) m/z: [M+H] = 506.

Fabrication of DM2-capped ZnO NPs: A cost-effective and straightforward sol-gel route was adopted for the fabrication of DM2-capped ZnO NPs. Typically, 3 mmol zinc nitrate hexahydrate and 2 mmol DM2 were dissolved in 5 mL anhydrous ethanol followed by stirring at ambient temperature. Parallel to this, a 3 mmol alcoholic NaOH solution (precipitating agent) was prepared in ethanol. Further, a few drops of NaOH solution were poured into the Zn^{2+} precursor solution until pH was adjusted to 8-9. The stirring was continued for another 2 h and a homogenous suspension was obtained. This resulted in a tailored structure of dipeptide-capped zinc oxide nanoparticles which were separated by ultracentrifugation. It was further treated several times with ethanol and water to ensure the extermination of undesirable impurities. The collected homogenous white precipitates were dried in a hot air oven for 3 h at 50°C. The as-prepared nanohybrid material was denoted as dipeptide-capped ZnO nanoparticles, DM2-capped ZnO NPs.

Photophysical and electrochemical studies of DM2 and DM2-capped ZnO NPs: The recognition studies of DM2 and DM2-capped ZnO NPs had been executed using 1 mM solutions of OPPs *viz.* diethyl cyanophosphate, diethyl chlorophosphate, phosmet, malathion, azinphos methyl, chlorpyrifos, profenofos, and quinalphos. The photophysical studies of DM2 were carried out by using a 0.2 mM solution of ligand DM2 in DMF owing to its excellent solubility in this aprotic solvent. It displayed an absorbance at λ_{273} nm ascribed to $\pi \rightarrow \pi^*$ transitions. The photophysical studies of DM2 were performed on a fluorescence spectrophotometer at room temperature. The binding studies were carried out by employing an excitation wavelength of 273 nm and the emission wavelength appeared at 321 nm. Further, the binding studies were performed using the 1 mM solutions of various OPPs (in water). The emission profiles were noted upon the addition of OPPs into volumetric flasks containing a 5 mL solution of DM2 as shown in Fig. S9. It was found that DM2 did not show a selective response towards any tested OPPs. Later, an organic-inorganic nanohybrid

material (DM2-capped ZnO NPs) was fabricated to characterize and explore the capping-related spectroscopic and electrochemical properties of DM2 capped over the surface of ZnO. The practical utility of the developed material, DM2-capped ZnO NPs was established by performing various secondary studies such as the effect of pH, salt perturbation, interference studies, response time studies, *etc.* The effect of acidic and basic pH was established using freshly prepared 1 mM HCl and 1 mM NaOH solutions respectively. Salt studies were performed by adding tertiary butyl ammonium perchlorate to a solution of DM2-capped ZnO NPs until the saturation point. For interference studies, 2-fold concentrations of tested OPPs were added to the complex of DM2-capped ZnO NPs+quinalphos. The response time studies of DM2-capped ZnO NPs for quinalphos were examined by noting its fluorescence profiles up to 140 s with varying concentrations of quinalphos (35, 70, and 105 nM). The cyclic voltammetry of DM2-capped ZnO NPs was performed using a glassy carbon electrode (GCE), Ag/AgCl, and platinum wire as the working electrode, reference electrode, and auxiliary/counter electrode respectively using 0.1 M PBS buffer (pH=7.4) as electrolyte medium and cyclic voltammograms were obtained in the -1.5 V to +1.5 V potential range at a scan rate of 100 mV/s. The scan rate studies were accomplished in the potential range of 10-250 mV/s. Before the onset of every experiment, the surface of the working electrode was prepared by polishing it with alumina slurry and washed thrice with ethanol and Milli-Q water. The reference electrode was filled with 3 M KCl solution before the onset of every experiment. The impedance studies were performed by employing 0.1 M KCl containing $[\text{Fe}(\text{CN})_6]^{3-/4-}$ in the 10^6 -0.001 Hz frequency range at open circuit voltage possessing a current amplitude of 5 mV. The current *vs.* time *i.e.*, amperometry titrations were performed in 0.01 M PBS buffer at a potential of +0.39 V and -0.39 V having a time duration of 0.01 s and a time interval of 60 s.

Secondary studies of DM2-capped ZnO NPs: The effect of pH was explored by adding 1 mM HCl and 1 mM NaOH solutions to DM2-capped ZnO NPs and the pH of the solution was varied from 3-11.5. Their FL intensity revealed that the material showed a stable response in varying pH ranges as shown in Fig. S12. A minimal salt effect was observed upon the gradual addition of TBA ClO_4^- to DM2-capped ZnO NPs as there were negligible changes in the FL intensity of DM2-capped ZnO NPs upon its addition up to 120 *eq.* as shown in Fig. S13. The effect of salt was also analyzed after the binding of quinalphos to DM2-capped ZnO NPs and interestingly, the complex showed a stable salt response as shown in Fig. S14. The ability of quinalphos to bind with DM2-capped ZnO NPs was also explored with time in the presence of varying concentrations of DM2-capped ZnO NPs+quinalphos. It was perceived that the quinalphos could bind with DM2-capped ZnO NPs within the first 20 s and the response remained unchanged up to 140 s as shown in Fig. S15. It could be concluded that the proposed material served well towards the selective recognition of quinalphos under given experimental conditions.

Cell culture and cytotoxicity analysis: The L929 fibroblast cell lines were procured from the National Chemical Laboratory, Pune. The cells were grown in 10% fetal bovine serum and 1% penicillin-streptomycin antibiotic solution in DMEM (Dulbecco's Modified Eagle Medium) media at 37°C and a 5% CO_2 humidified atmosphere. The cells were allowed to grow for 1-2 days before their analysis until their 80% growth was obtained. The grown cells were further stored in an incubator at 37°C and a 5% CO_2 humidified atmosphere. The suspension thus obtained was centrifuged at 2000 rpm for 2 min to result in the precipitation of cells. Later, the cells were rinsed thoroughly with trypsin and resuspended in DMEM. On average, 10,000 cells were spread and allowed to grow onto a culture plate before DM2-capped ZnO NPs tagging with varying concentrations (0.1, 0.2, 1, 2, 4 μg).
