Experimental Section

Scheme S1. The synthesis of MOC-Q3.

- 1. Synthesis of L-1-Br.** L-1-Br was prepared according to the previous literature.¹
- 2. Synthesis of L-2.** L-1-Br (2.30 g, 3.30 mmol), Pd(PPh₃)₄ (0.84 g, 0.73 mmol), and 3-pyridinylboronic acid (2.40 g, 19.80 mmol) were mixed in DMF (100 mL) in Schleck bottle, followed by adding K₂CO₃ aqueous solution (8 g, 56.1 mmol, 16 mL). The mixture was heated at 100°C for overnight under N₂, cooled down, filtered and extracted with dichloromethane. The organic extract was treated with aqueous ammonia and deionized water, dried by anhydrous sodium sulfate and filtrated. Silica-gel column chromatography (PE: EtOAc = 1:4 v/v) was used to purify the crude product and a golden solid L-2 of 1.20 g was obtained. Yield: 50.3%. ¹H NMR (400 MHz, DMSO-*d*₆) δ (ppm): 8.95 (d, *J* = 2.4 Hz, 1H), 8.51 (d, *J* = 4.7 Hz, 1H), 8.12-8.05 (m, 1H), 7.74-7.66 (m, 3H), 7.59-7.52 (m, 1H), 7.47 (dd, *J* = 8.1, 4.8 Hz, 1H), 7.17 (d, *J* = 8.3 Hz, 2H). ¹³C NMR (101 MHz, Chloroform-*d*) δ (ppm): 148.34, 146.67, 146.64, 144.62, 138.91, 132.54, 130.37, 128.95, 126.77, 125.23, 124.51, 123.69, 123.62. ESI-Q-TOF: 723.1705, *m/z* ([M+H]⁺). Elemental analysis (C₄₅H₃₀N₄S₃): Theoretical content (C 74.76%, H 4.18%, N 7.75%, S 13.31%); Actual content (C 74.72%, H 4.20%, N 7.80%, S 13.34%).
- 3. Synthesis of IrO₂·xH₂O colloid.** K₂IrCl₆ (120 mg, 0.25 mmol) and disodium hydrogen citrate (200 mg, 0.85 mmol) were mixed in deionized water (200 mL) in a Schleck bottle to give a reddish

brown solution. The pH of the mixture was adjusted to 7.5 by adding 0.25 M NaOH solution. The solution was stirred and heated at 95°C for 30 min, during which time it changed from reddish brown to light green. The pH of the solution was then measured again and adjusted to 7.5, followed by stirring for a further 30 min while maintaining the temperature at 95°C. At this stage the solution turned blue. The above steps were repeated until the pH was stabilized at 7.5, resulting in a dark blue solution. Finally, oxygen was introduced into the solution, which was stirred and heated at 95°C for a further 30 minutes, giving a dark blue colloidal $\text{IrO}_2 \cdot x\text{H}_2\text{O}$.

4. Characterizations. The steady-state and time-resolved photoluminescence (PL) spectra were tested on an Edinburgh FLSP980 fluorescence spectrometer. The cyclic voltammetry (CV) curves were recorded using a CH Instruments CHI760E electrochemical work station. X-ray photoelectron spectroscopy (XPS) were performed in an ultrahigh vacuum chamber (ESCALAB 250Xi) using an XR6 monochromated $\text{AlK}\alpha$ X-ray source ($h\nu = 1486.6$ eV) with a 900 mm spot size. The Pd contents in the samples were determined using inductively coupled plasma-atomic emission spectrometry (ICP-AES) (SPECTRO CIROS VISION, spectra range: 120-800 nm, and holographic grating: 2924 line/mm).

5. Apparent quantum yield (AQY) measurements for H_2 evolution. 20 mg Catalyst, 9 mL water and 1 mL TEOA were added into a sealed quartz bottle. The mixture was ultrasonic-dispersed and degassed by bubbling with N_2 for 30 min to degass. Then the mixture was stirred and irradiated with a monochromatic LED (Zolix, MLED4-1, $\lambda = 425$ nm, 450 nm or 515 nm), which photon flux were determined to be $1083.0 \mu\text{mol h}^{-1}$, $1,146.7 \mu\text{mol h}^{-1}$ and $1,312.3 \mu\text{mol h}^{-1}$, respectively. And the H_2 yields were detected by GC. And the AQYs were calculated as the following formula (1):

$$\Phi = \frac{\text{number of transferred electrons}}{\text{number of incident photons}} \times 100\% = \frac{2 \times n(\text{H}_2)}{n(\text{photons})} \times 100\% \quad (1)$$

6. Hydroxyl radical trapping experiment. 20 mg of g-C₃N₄, MOC-Q3 or g-C₃N₄/MOC-Q3 (11 wt%) was dispersed in a sealed 40 mL quartz bottle containing 10 mL aqueous solution containing 5×10⁻⁴ M terephthalic acid (TA) and 2×10⁻³ M NaOH. Then the mixture was stirred and irradiated under a 300 W Xenon lamp with a 420 nm cut-off filter for 1 h. After irradiation, the mixture was filtered using a membrane filter (aqueous phase), and the filtrate was used for fluorescence measurement.

Table S1. Theoretical and actual MOC contents of g-C₃N₄/MOC-Q3 (7/9/11/13 wt%).

Sample	Measured MOC content / wt%
g-C ₃ N ₄ /MOC-Q3 (7 wt%)	0.18
g-C ₃ N ₄ /MOC-Q3 (9 wt%)	0.23
g-C ₃ N ₄ /MOC-Q3 (11 wt%)	0.27
g-C ₃ N ₄ /MOC-Q3 (13 wt%)	0.33
IrO ₂ /g-C ₃ N ₄ /MOC-Q3	0.26

Table S2. Theoretical and actual IrO₂ contents of IrO₂ (2.04/1.63/1.36 wt%)/g-C₃N₄/MOC-Q3.

Sample	Measured IrO ₂ content / wt%
IrO ₂ (2.04 wt%)/g-C ₃ N ₄ /MOC-Q3	1.76
IrO ₂ (1.63 wt%)/g-C ₃ N ₄ /MOC-Q3	1.32
IrO ₂ (1.36 wt%)/g-C ₃ N ₄ /MOC-Q3	1.00

Figure S1. ^1H NMR spectra (400 MHz, $\text{DMSO}-d_6$) of A) ligand L-2 and B) MOC-Q3.

Figure S2. $^1\text{H}-^1\text{H}$ COSY spectrum (400 MHz, $\text{DMSO}-d_6$) of MOC-Q3.

Figure S3. ^1H DOSY spectrum (400 MHz, $\text{DMSO-}d_6$) of MOC-Q3.

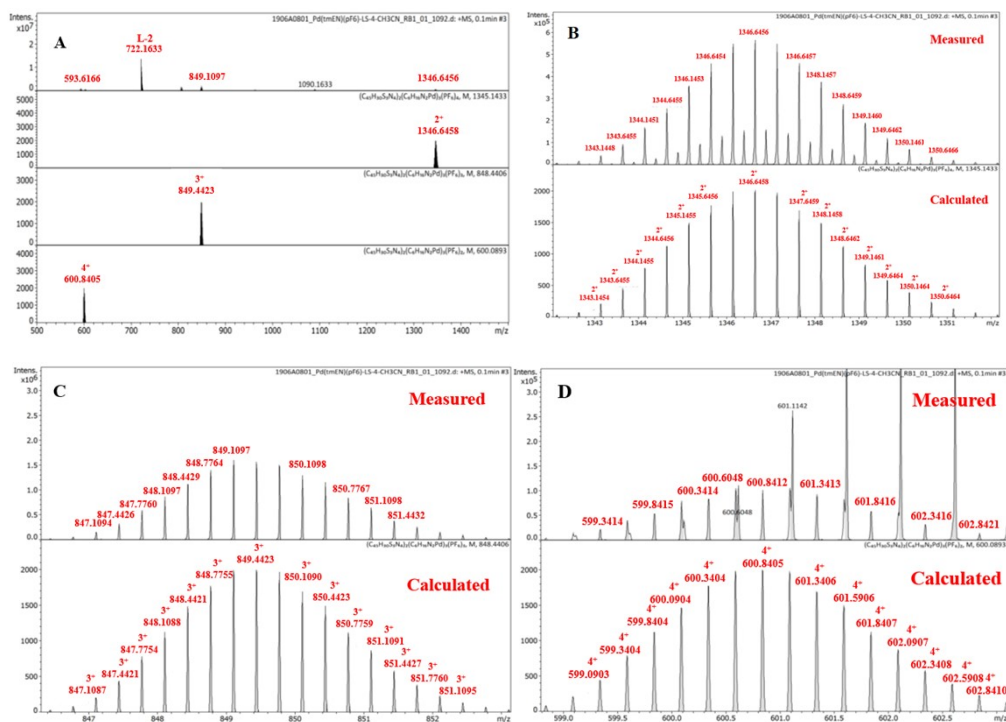

Figure S4. A) Full ESI-MS spectrum, and B-D) ESI-MS spectra of ion peaks for charge states 2^+ , 3^+ and 4^+ of MOC-Q3.

Table S3. The crystal data of MOC-Q3.

MOC-Q3	
Identification code	MOC-Q3
Empirical formula	C ₁₀₅ H ₁₀₂ N ₁₄ Pd ₃ S ₆
Formula weight	2071.56
Temperature/K	240.00(10)
Crystal system	hexagonal
Space group	P6 ₃ /m
a/Å	32.1234(11)
b/Å	32.1234(11)
c/Å	13.3475(5)
α/°	90
β/°	90
γ/°	120
Volume/Å ³	11928.2(7)
Z	2
ρ _{calc} /g/cm ³	0.577
μ/mm ⁻¹	2.471
F (000)	2128.0
Radiation	Cu Kα (λ = 1.54178)
2θ range for data collection/°	7.346 to 81.158
Index ranges	-22 ≤ h ≤ 10, -22 ≤ k ≤ 10, -9 ≤ l ≤ 10
Reflections collected	7544
Independent reflections	2564 [R _{in} = 0.0397, R _{sigma} = 0.0491]
Data/restraints/parameters	2564/515/257
Goodness-of-fit on F ²	0.955
Final R indexes [I ≥ 2σ (I)]	R ₁ = 0.1348, wR ₂ = 0.3490
Final R indexes [all data]	R ₁ = 0.1687, wR ₂ = 0.3731
Largest diff. peak/hole / e Å ⁻³	0.77/-0.72

Table S9. AQY(%) values of g-C₃N₄/MOC-Q3 (7/9/11/13 wt%) at different wavelengths.

Sample	AQY at 425 nm / %	AQY at 450 nm / %	AQY at 515 nm / %
g-C ₃ N ₄ /MOC-Q3 (7 wt%)	16.5	9.40	0.05
g-C ₃ N ₄ /MOC-Q3 (9 wt%)	21.9	10.3	0.07
g-C ₃ N ₄ /MOC-Q3 (11 wt%)	31.6	17.3	0.10
g-C ₃ N ₄ /MOC-Q3 (13 wt%)	23.5	12.2	0.08

Figure S9. Local potential of g-C₃N₄.

Figure S10. local potential of MOC-Q3.

Figure S11. Local potential of g-C₃N₄/MOC-Q3 model.

Figure S12. Charge transfer between g-C₃N₄/MOC-Q3 model. Yellow region lose electron; cyan region obtain electron. Red frames show charge loss of g-C₃N₄ due to NO₃⁻ groups.

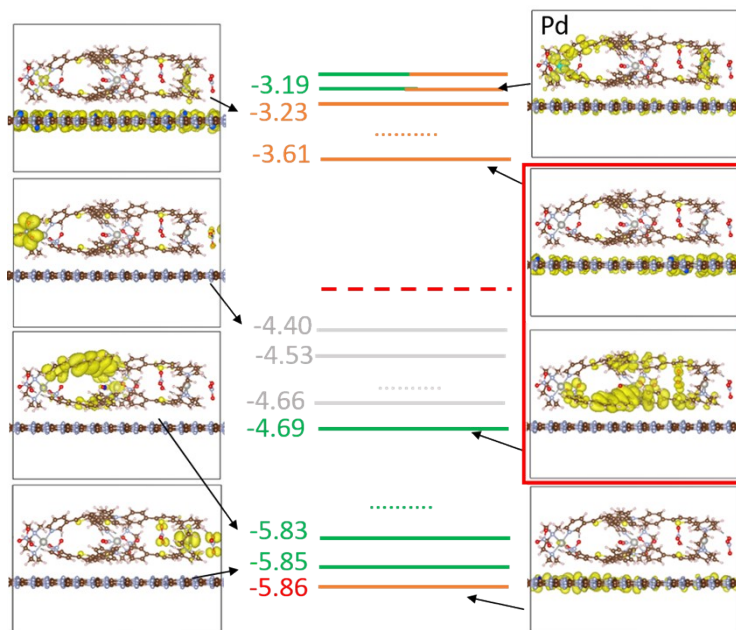

Figure S13. Energy levels near Fermi level and their corresponding orbitals of the $g\text{-C}_3\text{N}_4/\text{MOC-Q3}$ model.

Figure S14. A) SEM and B) TEM images of $\text{IrO}_2/g\text{-C}_3\text{N}_4/\text{MOC-Q3}$, C) PXRD, D) FT-IR spectroscopy, and E) UV-Vis solid absorption spectroscopy of $\text{IrO}_2/g\text{-C}_3\text{N}_4/\text{MOC-Q3}$ before and after long-term reaction.

Figure S15. The H₂ and O₂ production performances of IrO₂/g-C₃N₄/MOC-Q3 composites prepared at different calcination temperatures.

Figure S16. The H₂ and O₂ production performances of IrO₂ (2.04/1.63/1.36 wt%)/g-C₃N₄/MOC-Q3 composites.
