## General Information

### 1.1 Reagents

Materials required for the synthesis of DPA were purchased from Avra Chemicals. For ligand synthesis, TLC was used to monitor reaction progress using a Merck 60 F254 precoated silica gel plate (0.25 mm thickness), and the products were judged in a UV chamber. Both  $^1\text{H}$  and  $^{13}\text{C}\{^1\text{H}\}$  NMR spectra were collected using a Bruker 500 MHz spectrometer in DMSO- $d_6$ . Data for proton NMR chemical shifts are shown in ppm downfield from tetramethyl silane and are mentioned in delta ( $\delta$ ) units. The  $^1\text{H}$  NMR splitting patterns are singlet (s), doublet (d), triplet (t), and multiplet (m), and Mestre Nova processed the NMR data. Unless otherwise specified, chemicals were used exactly as received. CuI (>99%) from Loba Chemie Pvt. Ltd., and used without further purification. Solvents like diphenyl ether, acetonitrile (HPLC grade) were bought from Advent Chembio Pvt. Ltd.

### Instruments

Powder X-ray diffraction (PXRD) data were recorded on Rigaku Smart X-ray diffractometer with monochromatic Cu K $\alpha$  (0.1540 nm) radiation in  $2\theta$  range of 5-50 degrees. The attenuated total reflectance infrared spectroscopy (ATR-IR) was performed on Bruker Alpha II spectrophotometer of the powdered sample in the range of 4000-400  $\text{cm}^{-1}$ . We have used a field

emission scanning electron microscope (FE-SEM) on JEOL JSM-7400F for morphological characterization and its elemental mapping. The thermogravimetric analysis was performed on Mettler Toledo TGA 1-star e-system in the temperature range of 30-700 °C.

### Crystallographic details

Single crystal X-ray diffraction studies for **Cu-MOF** were carried out using Agilent technology (Oxford diffraction) super Nova CCD system, with monochromated Mo K $\alpha$  radiation ( $\lambda=0.71073$  Å). Unit cell determination, data collection and reduction, and empirical absorption correction were performed using the CrysAlisPro program. Using Olex2<sup>1</sup>, the structure was solved with the SHELXT<sup>2</sup> structure solution program using Intrinsic phasing and refined with the SHELXL refinement package using Least Squares minimisation.

### Sensing Measurements

5N purity gases such as (NO<sub>2</sub>, NH<sub>3</sub>, H<sub>2</sub>S, SO<sub>2</sub>, and CO<sub>2</sub>) are employed to measure the sensing performance of the fabricated sensor. The flow rate of these gases is precisely controlled by using an advanced mass flow controller (model: Alicat, MC11 slpm, USA). The concentration of these test gases is varied by mixing the synthetic air (99.999 Purity) into the mixing chamber before exposing it on the sensor surface. The resistance change of the sensing layer during test gas exposure is continuously monitored on the Keithley-2612A source meter by applying a constant voltage of +1 V.

### 2.1 Synthesis of *N*-phenyl-*N*-(pyridine-4-yl)pyridine-4-amine (PDPA)

4,4'-Dipyridylamine (DPA) was synthesized following a previous report by Bureš *et al.*<sup>3</sup> For the synthesis of PDPA, in a two-neck r.b., DPA (2000 mg, 11.7 mmol) was added with CuSO<sub>4</sub>(360 mg, 2.2 mmol), 18-crown-6 (120 mg, 0.05 mmol), potassium carbonate (3200mg, 23.4 mmol) with bromobenzene (3.6 mL, 34.8 mmol) in diphenyl ether (15 mL). The reaction temperature was maintained at 450K for two days in N<sub>2</sub>. 2 days later, 200 mL of DCM and 200 mL of MeOH were added to the reaction mixture and passed through the celite pad. Most of the solvent was dried except diphenyl ether. Solvent and other impurities were removed and the compound was purified by column chromatography (Ph<sub>2</sub>O and bromobenzene were removed by hexane as eluent and PDPA was obtained in ethyl acetate as eluent). (Yield:2000 mg, ~70%). <sup>1</sup>H NMR (500 MHz, DMSO-d<sub>6</sub>)  $\delta$  8.41 (s, 4H), 7.50 (t,  $J = 7.7$  Hz, 2H), 7.37 (t,  $J = 7.6$  Hz, 1H), 7.23 (d,  $J = 8.1$  Hz, 2H), 6.95 (d,  $J = 4.7$  Hz, 4H). <sup>13</sup>C{<sup>1</sup>H} NMR (126 MHz,

DMSO-d<sub>6</sub>)  $\delta$  150.99, 150.16, 143.03, 129.92, 127.17, 126.52, 115.52. LCMS (ESI)  $m/z$  calculated for C<sub>16</sub>H<sub>13</sub>N<sub>3</sub> [M+H]<sup>+</sup> 248.1182, found 248.1201.

Figure S3.  $^1\text{H}$  NMR of PDPA

Figure S4.  $^{13}\text{C}\{^1\text{H}\}$  NMR of PDPA

## 2.5 Synthesis of Cu-MOF

Into a 50 mL Schenk tube under N<sub>2</sub> condition, PDPA (100 mg, 0.8 mmol) was dissolved in 2 mL DCM, to which CuI (153 mg, 1.6 mmol) dissolved in 10 mL ACN was added and resulted in instant white precipitates. The reaction mixture was stirred for 12 hours, after which the compound was dried and washed with ACN. (Yield: 200 mg, ~80%). Crystals were obtained by slow diffusion of CuI dissolved in ACN over ligand dissolved in DCM.
