1

2 **Figure S10.** Schematic diagram of the test results of adhesion performance of hydrogel  
3 film scaffolds on the surface of artificial cervix at different humidity. In this experiment,  
4 the effect of humidity on adhesion was quantitatively analyzed through 20 cycles of  
5 adhesion and peeling process. When the surface of the artificial cervix was kept wet,  
6 the adhesion force of the hydrogel film scaffold was stable at about 22 kPa; while in  
7 the dry state, the adhesion force decreased to about 6.5 kPa.

---

1 **Movie S1**

2 **Video of adhesion testing of catheter-based pressure transducers decorated with**

3 **composite hydrogel scaffolds.** The sensor is placed into a moist artificial cervix that

4 mimics a healthy cervix, and the artificial cervix is wiggled up and down without the

5 sensor becoming ectopic or displaced.

6

7

---

1 **Movie S2**

2 **Video of adhesion testing of catheter-based pressure transducers decorated with**

3 **composite hydrogel scaffolds.** A citric acid solution with a pH of 3 was used to

4 simulate the passage of biological fluids on the surface of the cervical tissue, and neither

5 the hydrogel scaffold nor the catheter became ectopic or displaced when the solution

6 dripped.
