## Experimental

### General

A Bruker AVANCE III 400 NMR spectrometer ( $^1\text{H}$ : 400 MHz and  $^{13}\text{C}$ : 100 MHz) was used for recording  $^1\text{H}$  and  $^{13}\text{C}$  NMR spectra in chloroform-*d* ( $\text{CDCl}_3$ ) solutions, and chemical shifts were reported in parts per million (ppm) using residual protons in the NMR solvent. The Bruker AVANCE III 400 NMR spectrometer was used for recording  $^{19}\text{F}$  NMR (376 MHz) spectra in  $\text{CDCl}_3$  solutions with  $\text{CFCl}_3$  ( $\delta_{\text{F}} = 0.0$  ppm) or hexafluorobenzene ( $\delta_{\text{F}} = -163$  ppm) as the internal standard. IR spectra were recorded using the KBr method with a JASCO FT/IR-4100 type spectrometer; all spectra are reported in wavenumbers ( $\text{cm}^{-1}$ ). HRMS data were recorded by a JEOL JMS-700MS spectrometer using the fast atom bombardment method. Dried glassware and a magnetic stirrer were used for all reactions. Reagent-grade chemicals were used after purification in the usual manner. Silica gel (Wakogel<sup>®</sup> 60N, 38-100  $\mu\text{m}$ ) was used for column chromatography and silica gel TLC plates (Merck, Silica gel 60F<sub>254</sub>) were used for TLC analysis.

### Synthesis of IndCBZ-F through nucleophilic aromatic substitution

2-Ethynylindolo[3,2,1-*jk*]carbazole (0.3 g, 1.1 mmol) was placed in a two-necked round bottomed flask containing THF (11 mL). The flask was equipped with a Teflon<sup>®</sup>-coated stirring bar and cooled to 0 °C. Subsequently, a solution of *n*-BuLi (1.6 mol L<sup>-1</sup> hexane solution, 0.70 mL, 1.1 mmol) was slowly added to the mixture. After stirring for 30 min, pentafluorobenzonitrile (1.57 g/mL, 0.21 mL, 1.7 mmol) was gradually added to the mixture. Subsequently, after stirring for 1 h, the reaction mixture was heated to room temperature, stirred for 18 h, and poured into a saturated  $\text{NH}_4\text{Cl}$  solution. The crude product was extracted with EtOAc (thrice) and the combined organic layer was washed with brine (once). The organic layer was subsequently dried over anhydrous  $\text{Na}_2\text{SO}_4$  and separated via filtration. The filtrate was evaporated in vacuo and purified by silica-gel column chromatography (hexane/ $\text{CH}_2\text{Cl}_2 = 1/1$ ) to generate the corresponding product **IndCBZ-F** (0.053 g, 0.12 mmol) in 11% isolated yield as a yellow solid. Further recrystallization from  $\text{CH}_2\text{Cl}_2$ /hexane produced yellow crystals that were sufficiently pure for photophysical analysis.

## Crystallographic analysis

Single crystal X-ray diffractions were recorded on an XtaLab AFC11 diffractometer (Rigaku). The reflection data were integrated, scaled, and averaged using CrysAlisPro (ver. 1.171.39.43a, Rigaku). Empirical absorption corrections were applied using the SCALE 3 ABSPACK scaling algorithm (CrysAlisPro). The structure was identified by a direct method (SHELXT-2018/2) and refined using a full matrix least square method (SHELXL-2014/7) visualized by Olex2. The crystallographic data were deposited into the Cambridge Crystallographic Data Centre (CCDC) database.

### DFT calculation

All computations were carried out using density functional theory (DFT) with the Gaussian 16 (Rev. B.01)<sup>[1]</sup> package. Geometry optimizations were executed using the CAM-B3LYP hybrid functional and 6-31+G(d,p) basis set.<sup>[2]</sup> Vertical excitations were also calculated using a TD-DFT method at the same level of theory except for geometry optimizations at excited state.

## Photophysical Characteristics

UV-vis absorption spectra were recorded using a JASCO V-530 and V-750 absorption spectrometer (JASCO, Japan). PL spectra of the solution was measured using a Rf-6000 (Shimadzu, Japan). Photoluminescence quantum yields were measured using Quantaaurus-QY C11347-01 series (Hamamatsu Photonics, Japan). PL lifetime was measured using a Quantaaurus-Tau fluorescence lifetime spectrometer C11367-34 (Hamamatsu Photonics, Japan).

### Lippert-Mataga Plot <sup>[3]</sup>

$$\Delta\nu = \frac{2(\mu_e - \mu_g)^2}{hca^3} \left( \frac{\varepsilon - 1}{2\varepsilon + 1} - \frac{n^2 - 1}{2n^2 + 1} \right) = \frac{2(\mu_e - \mu_g)^2}{hca^3} \Delta f + \text{const.}$$

Where  $h$  is the Plank's constant,  $c$  is the velocity of light, and  $a_0$  is Onsager cavity radius. The solvent parameters  $\varepsilon$  and  $n$  are solvent dielectric constant and refraction index, respectively. The Onsager radius ( $a_0 = 6.00 \text{ \AA}$  for **IndCBZ-F**,  $5.74 \text{ \AA}$  for **JLD-F** and  $5.86 \text{ \AA}$  for **TMeJLD-F**) was calculated from DFT optimization.

## PMMA film

Thin films of synthetic derivatives were prepared using Opticoat MS-B100 spin coater (MIKASA, Japan). The solutions of PMMA (100 mg) in  $\text{CHCl}_3$  (3 mL) containing varying amounts of derivatives in the range from 1.0 weight per weight were prepared. Then, the thoroughly cleaned glass slide was mounted and clamped on the top rotating plate of a spin coater. Few drops of a solution of PMMA in  $\text{CHCl}_3$  containing calculated amounts of derivatives were placed on the glass slide and the top plate of spin coater kept rotating at the speed of 500 revolutions per minute (rpm) for 5 seconds, then at 750 rpm for an additional 5 seconds, and finally at 1200 rpm for 10 seconds. The solvent evaporates and a thin smooth film was seen deposited on a glass slide. The prepared films were used for photophysical measurements without further drying the solvent.
