We tried to fit the χ -T data at higher temperature. This type fitting yields similar Weiss constants to the fitting of $1/\chi$ -T data, as shown in the below Table S8. An example of $(2\text{-Brba})_2\text{CuBr}_4$ compound is shown in Figure S16, which is fitted between 20-300 K. For the Cu-based perovskites, researchers usually fit the $1/\chi$ -T data to obtain the Curie constant C and Weiss constant θ .^{1,2} On the other hand, here we focus on the positivity or negativity of the Weiss constant. The positive Weiss temperature is further evidence supporting the existence of ferromagnetic interactions.
