6.Binding Experiments

The association between the HIM **6b-6c** and different anions was analyzed utilizing ^1H NMR spectrometry in deuterated chloroform. From the ^1H NMR study, the data was used to determine the binding constant between the HIM and anion in Bindfit (<http://app.supramolecular.org/bindfit/>). Three different HIMs (**6a-c**) were compared for their binding affinity with Cl^- and Br^- . Tetrabutylammonium salts were used for the experiment.

In case of HIM **6b**, an incremental equivalent addition of salt to the HIM was performed for this experiment. Stock solution (A) of HIM was prepared at a concentration of 4.3 mM (12.9 mM in monomer) which was kept constant throughout the process. A portion of HIM stock was used to prepare salt stock (B) at an equivalence of 20 to 40 times. 0.5 mL of stock A was taken to the NMR tube and the spectra ^1H NMR spectrum was recorded.

For chloride anion: Stock solution B (with TBA(Cl)) was added stepwise in a 0.1 equivalence (versus the HIM) until a 1:2 equivalence of HIM to salt was added. After each stepwise addition of stock B to the NMR tube of stock A, ^1H NMR was recorded. After 2 equivalence of stock B was added to the NMR tube the increment rate increased to 1 equivalence for each addition till the last addition.

For bromide anion: Stock solution B (with TBA(Br)) was added stepwise in a 0.1 equivalence (versus the HIM) increase until a 1:2.4 equivalence of HIM to salt was added. After each stepwise addition of stock B to the NMR tube of stock A, ^1H NMR was recorded. The incremental rate increased to 0.2 equivalency from 2.4 to 3.0 equivalence and 0.5 equivalence from 3.0 to 4 equivalence. After 4 equivalence of stock B was added to the NMR tube the increment rate kept 1 equivalence for each addition till the last addition.

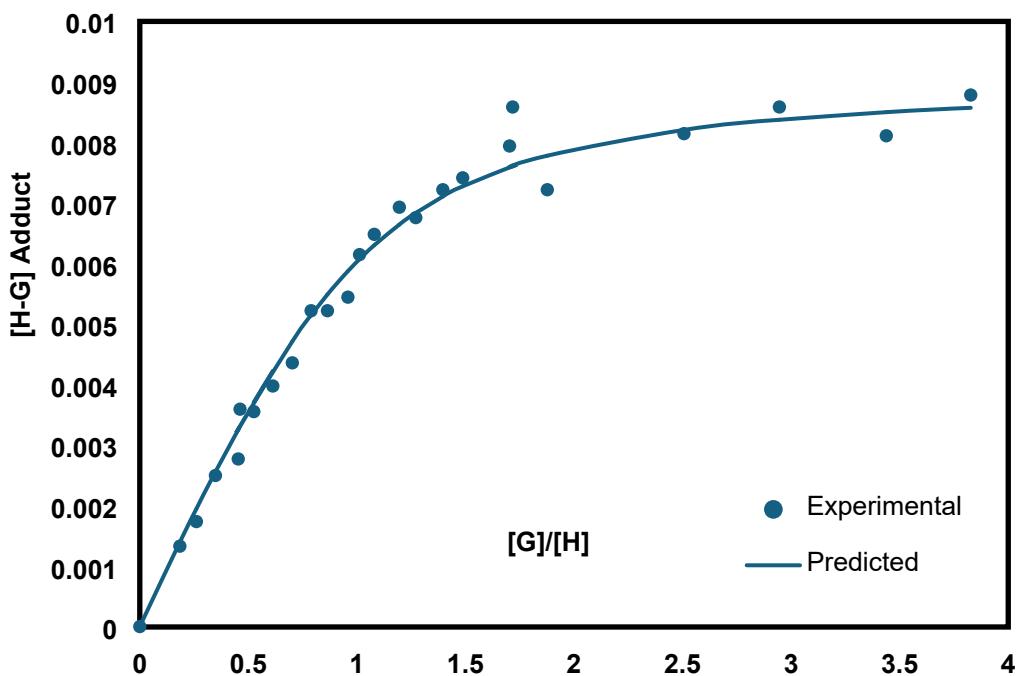

Figure SI10: Binding Isotherm of HIM **6b** with TBA(Cl).

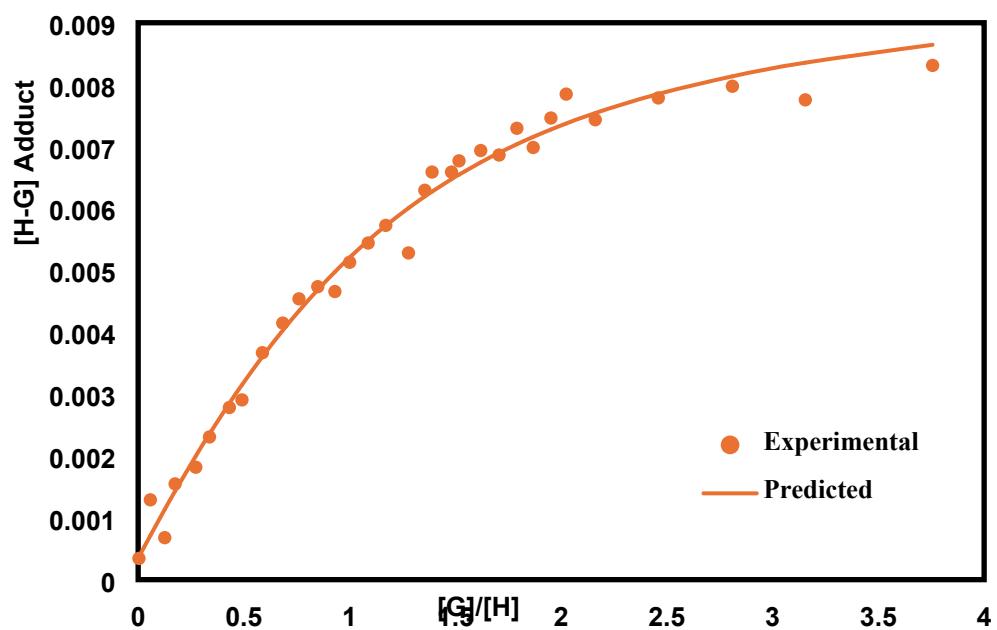

Figure SI11: Binding Isotherm of HIM **6b** with TBA(Br).

In case of **6c**, an incremental equivalent addition of salt to the HIM was performed for this experiment. Stock solution (A) of HIM was prepared at a concentration of 4.3 mM (12.9 mM in monomer) which was kept constant throughout the process. A portion of HIM stock was used to prepare salt stock (B) at an equivalence of 20 to 40 times. 0.5 mL of stock A was taken to the NMR tube and the spectra ^1H NMR spectrum was recorded.

For chloride anion: Then stock B (with TBA-Cl) was added stepwise in a 0.1 equivalence (verses the HIM) increase until a 0.6 equivalence of HIM to salt was added. After each stepwise addition of stock B to the NMR tube of stock A, ^1H NMR was recorded. The incremental rate increased to 0.2 equivalency from 0.6 to 2.0 equivalence and added 0.5 equivalence from 2.0 to 3 equivalence. After 3 equivalence of stock B was added to the NMR tube the increment rate kept 1 equivalence for each addition till the last addition.

For bromide anion: Initially 0.1 equivalence of stock B (with TBA-Br) was added and then stock B (with TBA-Br) was added stepwise in a 0.2 equivalence (verses the HIM) increase until a 1:4 equivalence of HIM to salt was added. After each stepwise addition of stock B to the NMR tube of stock A, ^1H NMR was recorded. The incremental rate increased to 0.5 equivalency from 4.0 to 5.0 equivalence. After 5.0 equivalence of stock B was added to the NMR tube the increment rate kept 1 equivalence for each addition till the last addition.

8.Experimental Section

Unless otherwise noted, all reagents were used as received and all reactions were carried out under an argon atmosphere. Column chromatography was performed on a CombiFlash® Rf system with Redisep normal phase silica columns (Teledyne ISCO Inc., Lincoln, NE). NMR were recorded on a Varian 400 MHz NMR station at room temperature, unless otherwise noted. High resolution mass spectra were obtained from the University of Illinois Mass Spectrometry Services.

Compound 3a, 4a, and 6a were previously prepared. (J. Org. Chem., **2024**, 89, 7437-7445.)

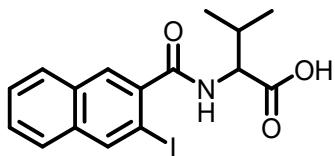

3-Iodo-2-naphthoic acid. To an ice-cold stirred suspension of commercially available 3-amino-2-naphthoic acid (1.0 g, 5.34 mmol) in 40 mL of a 1:1 mixture of 37% aqueous HCl (20 mL) and H₂O (20 mL) was slowly added an aqueous solution of NaNO₂ (737 mg, 10.7 mmol, in 10 mL of distilled water). The resulting orange solution was stirred at 0 °C for 2 h, after which time an aqueous solution of KI (5.30 g, 32.0 mmol, in 10 mL of distilled water) was added dropwise. The mixture was stirred at 0 °C for 30 min, then at room temperature for 1 h, and finally heated at 60 °C for 1 h. EtOAc (20 mL) was then poured into the mixture and heating was maintained for an additional 30 min. Powdered Na₂S₂O₃ was added until complete de-colorization of the solution. The solid was removed by filtration. The reaction mixture was then extracted with EtOAc (4 x 25 mL). The organic layers were combined, washed with brine (100 mL), dried over MgSO₄, filtered, and evaporated to dryness. The resulting brown oily residue was purified by column chromatography (Hexane/EtOAc, 1:1) to yield 1.2 g (75%) as a beige solid. ¹H NMR (400 MHz, DMSO) δ 8.63 (s, 1H), 8.36 (s, 1H), 8.04 (d, *J* = 7.6 Hz, 1H), 7.93 (d, *J* = 7.8 Hz, 1H), 7.67 – 7.58 (m, 2H). ¹³C{¹H} NMR (400 MHz, DMSO) δ 168.1, 139.7, 135.0, 133.1, 131.2, 130.2, 128.6, 127.4, 126.6, 89.6. 9.Crystallographic Information

Intensity data were collected on a Bruker D8 Venture kappa diffractometer equipped with a Photon II CPAD detector. An $\text{I}\mu\text{s}$ microfocus Mo source ($\lambda = 0.71073 \text{ \AA}$) coupled with a multi-layer mirror monochromator provided the incident beam. The sample was mounted on a 0.3 mm nylon loop with the minimal amount of Paratone-N oil. Data was collected at 100 K using a cold stream of N₂(g) provided by an Oxford Cryostream 700 LT device. Preliminary unit cell constants were determined with a set of 24 narrow frame scans. Data was collected as a series of ϕ and/or ω scans with typical scan width of 0.5° and counting time of 10-30 seconds/frame at a crystal to detector distance of ~3.7 cm. The collection, cell refinement, and integration of intensity data was carried out with the APEX3 software.¹ Final cell constants were determined by global refinement of reflections from the complete data set. A multi-scan absorption correction was performed with SADABS.² The structure was phased with intrinsic methods using SHELXT3 and refined with the full-matrix least-squares program SHELXL.⁴

Valine HIM in Naphthalene system

CCDC # 2388281

The structure was confirmed by obtaining a single crystal that was solved using X-ray diffraction. The single crystal of valine HIM in naphthalene system, **6b** suitable for X-ray crystallography was obtained using chloroform and diethyl ether by vapor diffusion method. The single crystal was run at 100K using a wavelength of 0.71073 Å°. From the analysis of single crystal data set, analogous to the previously reported single crystal structure of valine HIM and Phenylalanine HIM, valine HIM in naphthalene system is also a distorted planner macrocyclic system consisting of the amino acids carbonyl oxygen facing inside the ring. All three isopropyl groups are located above the plane.

Symmetry transformations used to generate equivalent atoms:

10.DFT calculations

DFT Calculations were performed on 11 systems using Gaussian16W software. Geometry optimization and frequency calculations were performed on the systems mentioned in the table below. All calculations were in the ground state using B3LYP method and 6-31G(d,p) basis set for all atoms except iodine, which were handled with LanL2DZ basis set. The systems were optimized in chloroform solvent using the PCM solvent model. For each optimized structure, 0 imaginary frequencies were found, indicating the structure optimization had reached a minimum. For the purpose of calculating binding energy, an energy calculation was performed on a Cl atom and a Br atom using the same method and 6-31G(d,p) basis set in chloroform solvent by PCM model. We note that the DFT calculations were performed using a smaller basis set, which may result in a high basis set superposition error. Additionally, dispersion interactions were not included in the calculations. We are currently exploring various methods and basis sets to estimate the accuracy of these results and will report our findings in future work.

The relative binding energies in Table 2 in manuscript are calculated based on the binding energies shown in table below.
