Figure S26. Log (S_g-1) vs. log C_g curve of ADC Pd/SnO₂ sensor response to CO at 60 °C, where S_g is the sensor response (defined previously as R_a/R_g), expressed by Eq. 1 in the main text and C_g is the gas concentration.26

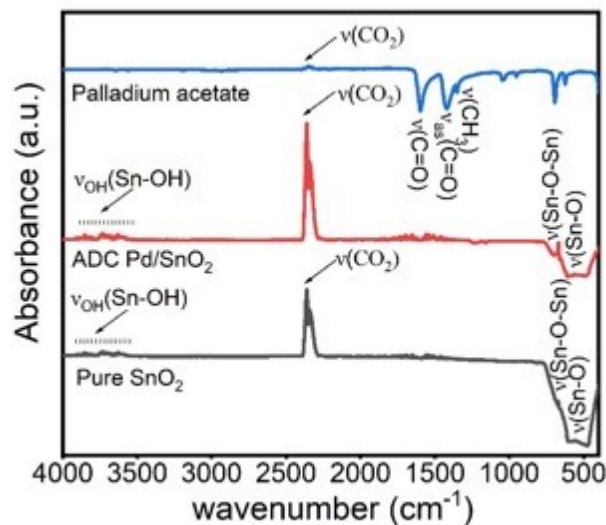

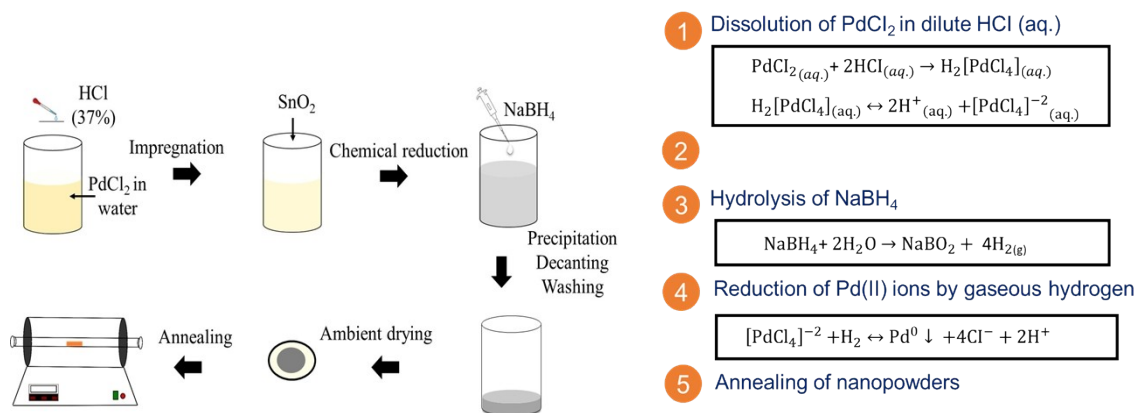

Figure S1. FTIR spectra of palladium acetate, ADC Pd/SnO₂, and pure SnO₂. The band at 2360 cm⁻¹ is assigned to atmospheric CO₂.

Scheme S1. Preparation of Pd nanoparticles on SnO₂

Preparation of Pd nanoparticles on SnO₂

For comparison, Pd nanoparticles loaded onto SnO₂, labeled as Pd NPs/SnO₂, was synthesized via wet impregnation of Pd precursor onto SnO₂ support and chemical reduction of Pd ions, followed by an annealing step (Scheme S1). PdCl₂ was employed as the Pd²⁺ precursor, and sodium borohydride (NaBH₄) was used as the reducing agent to reduce the Pd metal ions into Pd metal nanoparticles. 24 mg PdCl₂ was dissolved in 100 ml DI water in the presence of a few drops of concentrated hydrochloric acid. and stirred until it was completely dissolved. 0.5 g of SnO₂ was then added in the PdCl₂ solution under continuous stirring at room temperature for 3 h. Following the impregnation of Pd complex onto the SnO₂ nanocrystals, 3 ml of 87.2 mM fresh

NaBH₄ solution was added into the solution under stirring for 3h to reduce the Pd metal ions. The color of the suspension changed from yellow to gray, which indicates that Pd nanoparticles precipitated on the SnO₂ nanocrystals. The prepared Pd NPs/SnO₂ catalysts were washed with DI water and ethanol several times, respectively, and the precipitate was dried at room temperature overnight. Finally, the obtained gray powder was annealed at 500 °C in atmospheric air at ambient pressure for 3h, which yielded brownish powder. The presence of Pd, Sn and O in the full spectrum scan of XPS in Figure S11 is evidenced without any impurity elements, suggesting complete removal of Cl⁻ and the formation of Pd-O-Sn based catalyst.

Figure S2. Chemiresistive gas sensor fabrication: a) Optical image of a Pt/Ti IDE with an active area of 3.5 mm in length, composed of 90 finger pairs of 5 μm width and spacing between each parallel electrode finger on glass substrate (10 x 6 x 0.75 mm). b) Optical image of the active area of the Pt/Ti IDE. c) Schematic of sensor fabrication following drop-casting a colloidal solution of the as-synthesized catalysts onto the pre-cleaned Pt-Ti interdigitated electrode; evaporation of the solvent; and post-deposition annealing treatment of the deposited sensing layer; and subsequently conductive wire-bonding.

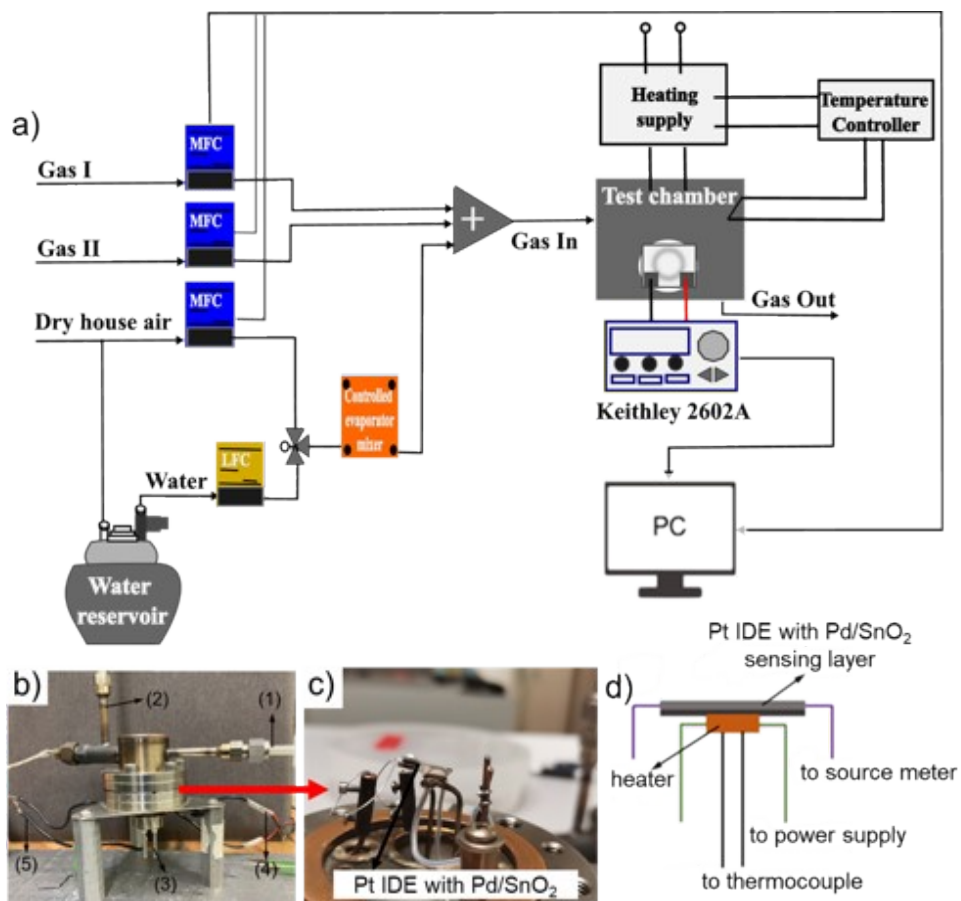

Figure S3. Gas sensing test apparatus: (a) Gas delivery system and gas sensing test setup. (b) Photo of the test chamber: (1) gas inlet; (2) gas outlet; (3) to thermocouple to measure the temperature of the heater; (4) to DC heater power supply to control the operating temperature of the sensor; (5) to source meter to measure the resistance of the sensor. (c) Internal view of the test chamber with Pd/Ti electrode installed. (d) Schematic diagram of the side-view of the sensor, heater, and electrical connections.

Figure S4. Definition of sensor response, response and recovery times.

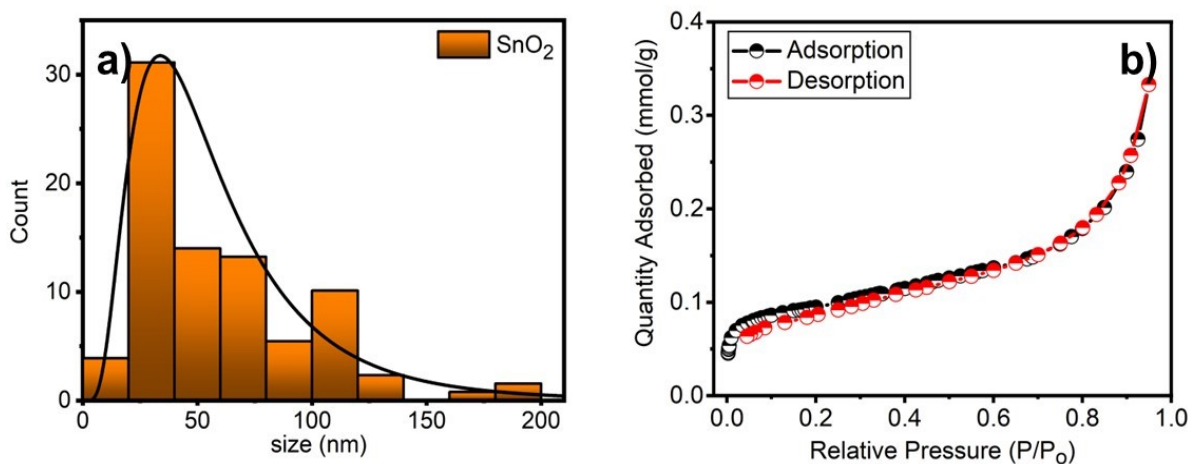

Figure S5. **a)** Particle size distribution histogram for the STEM image of SnO₂ support in Figure 1 in the main text. Scale bar, 50 nm. **b)** Nitrogen adsorption-desorption isotherm of SnO₂ support at 77 K. About 180 mg of SnO₂ support pre-annealed at 500 °C was degassed at 300 °C overnight before analysis. N₂ adsorption-desorption isotherm of annealed SnO₂ suggests type II isotherm, typical for non-porous materials, on which total Brunauer–Emmett–Teller (BET) surface area was calculated as 7.5 m².g⁻¹.

Figure S6. Representative FESEM images of a) SnO_2 , b) Pd NPs/ SnO_2 and ADC Pd / SnO_2 , respectively. Scale bars, 100 nm, 200 nm, respectively.

Figure S7. a) STEM image of Pd NPs/ SnO_2 and its corresponding EDS elemental mapping images of Pd, O and Sn. Scale bars, 100 nm. b) HRTEM image of Pd NPs/ SnO_2 . Scale bar, 5 nm. c) EDS analysis showing presence of Pd element in the Pd NPs/ SnO_2 .

Figure S8. Structural and morphological characterization of ADC Pd/SnO₂: a-b) High magnification HAADF-STEM images of ADC Pd/SnO₂. Scale bars, 20 nm and 5nm, respectively.

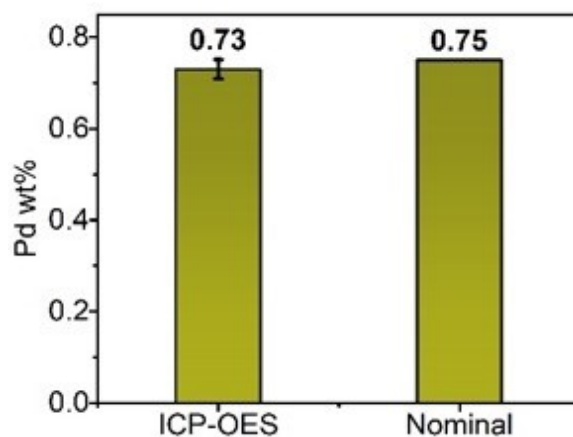

Figure S9. Comparison of actual Pd loading in ADC Pd/SnO₂ quantified via ICP-OES with its nominal loading

Table S1. X-ray photoelectron spectroscopy analyses data

Line (sensitivity factor)	Measured Signal (x 10 ³)	Calculated Intensity (x 10 ³)
O 1s (0.711)	173	243
Sn 3d _{5/2} (4.41)	507	115
Pd 3d (5.00)	90	18

Scheme S2. A simple model assuming one atom thick Pd covers SnO₂ support. x represents the fractional coverage of one-atom thick Pd, d donates 0.3 nm, and λ is Sn photoelectron m.f.p. in Pd = 1.0 nm

The Pd atom number density on SnO₂ was estimated to be:

$$I_{Sn} = I_0[1 - x + xe^{-d/\lambda}] \quad (S1)$$

$$I_{Pd} = I_0x(1 - e^{-d/\lambda}) \quad (S2)$$

$$\Rightarrow x \approx 0.53$$

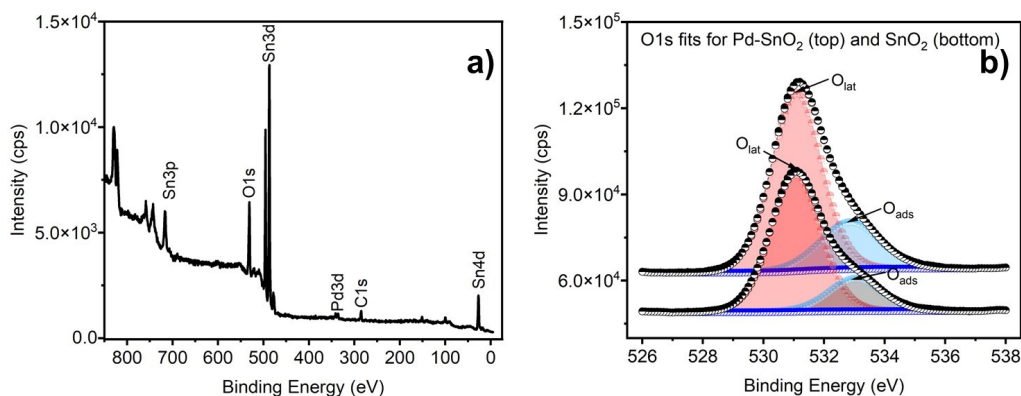

Figure S10. XPS spectra of the as prepared ADC Pd/SnO₂. a) ADC Pd/SnO₂ wide scan. b) Oxygen core level spectra of SnO₂ and ADC Pd/SnO₂: O 1s peaks of SnO₂, and ADC Pd/SnO₂ were deconvoluted and assigned to two major subpeaks. The first peak (O1) at 531.1 eV is attributed to the lattice oxygen vacancies (O_{latt}), the second peak at 532.8 eV to the surface OH group (O_{ads}).

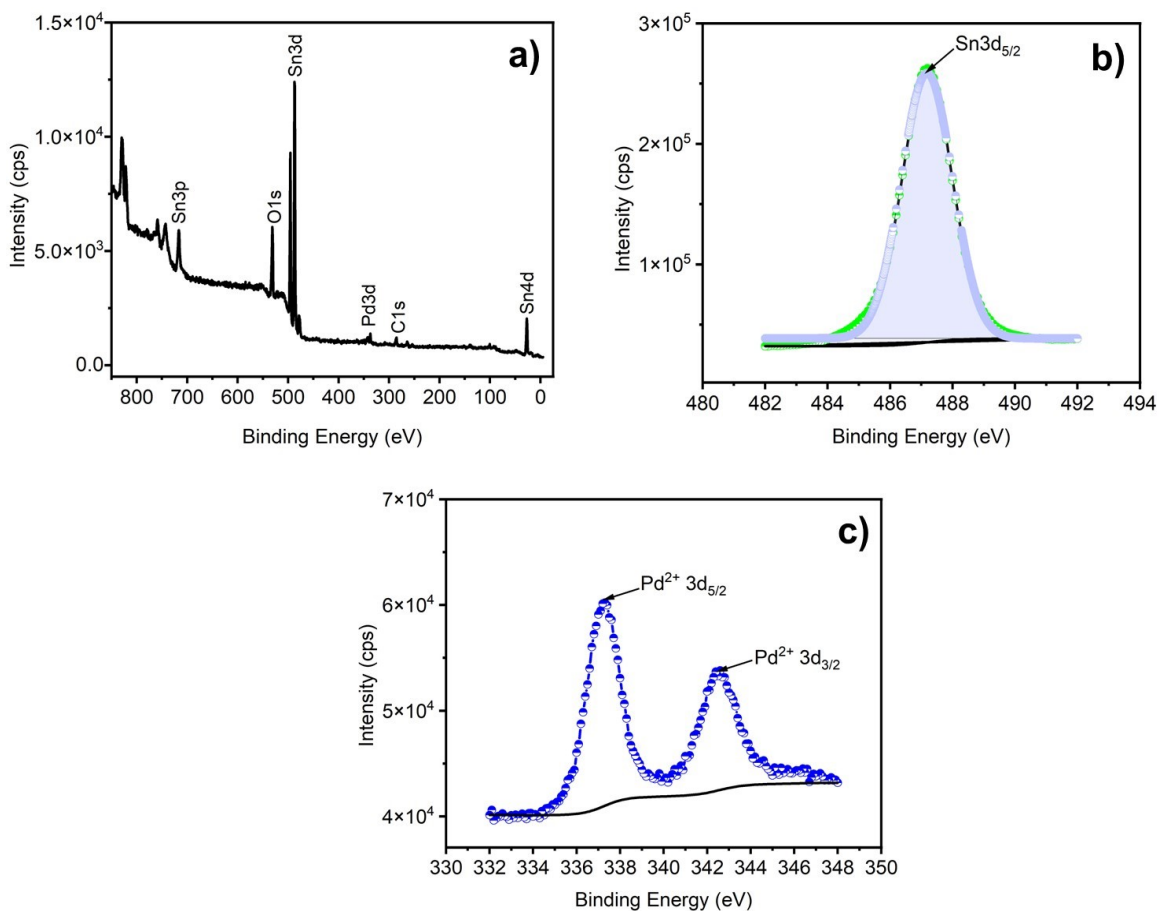

Figure S11. XPS characterization of Pd NP/SnO₂: a) The full spectrum scan of XPS; b) Sn 3d_{5/2} region of Pd NP/SnO₂; c) Pd 3d region of Pd NP/SnO₂.

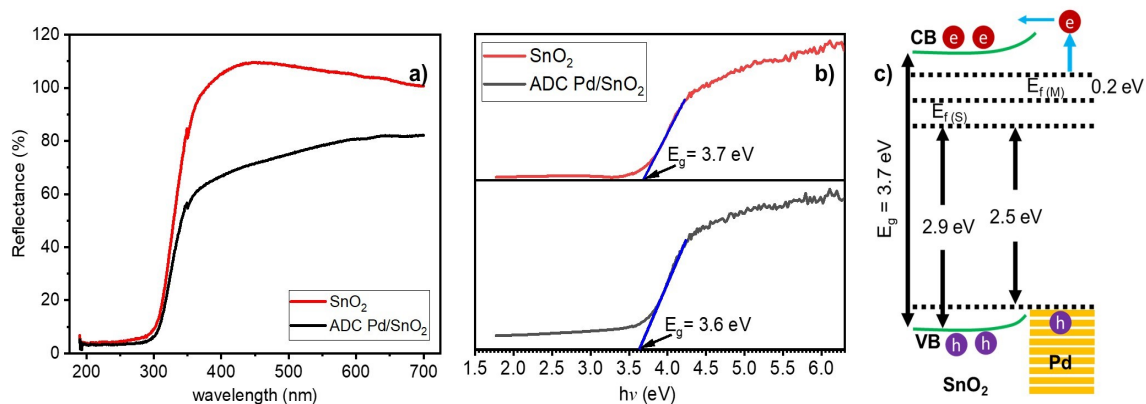

Figure S12. a) UV-vis diffuse reflectance spectra (DRS) of pure SnO₂ and ADC Pd/SnO₂; b) Respective Kubelka Munk function for estimating the band gap energy. c) Proposed band structure diagram for SnO₂ and ADC Pd/SnO₂.

Table S2. Types and number of scattering paths expected for different structural models. The ADC Model 3 is consistent with the EXAFS modeling of ADC Pd/SnO₂ sample.

	Pd-Pd interaction			Pd-Sn interaction		
	Scattering Path	CN	R (Å)	Scattering Path	CN	R (Å)
PdO Sheet	Pd-O	4	2.01	Pd-O	-	-
