1. Experimental section

1.1 Materials and reagents

The following chemicals were purchased and used without further purification: Ammonia chloride ($C_8H_{20}NCl$, 99.9%, Macklin), tin^(IV) chloride pentahydrate ($SnCl_4 \cdot 5H_2O$, 99.995%, Macklin), hydrochloric acid (HCl, AR, 37 wt%, Harbin Polytechnic Chem. Reag. Co. Ltd), Tellurium dioxide ($TeO_2SnCl_4 \cdot 5H_2O$, 99.995%, Macklin) and Isopropyl alcohol (C_3H_8O , AR, 99.5%, Macklin).

1.2 Preparation and growth of $(TEA)_2SnCl_6 \cdot x\% Te$

The hydrothermal method was employed to synthesize NSCs and NSTCs. Initially, 2 mmol of $C_8H_{20}NCl$, (1- x) mmol of $SnCl_4 \cdot 5H_2O$, x mmol of TeO_2 (where $x=0, 0.001, 0.005, 0.01, 0.05, 0.10, 0.20$ mmol), and 6 ml of HCl were sequentially added to a 25 mL polytetrafluoroethylene (PTFE) container. Subsequently, the mixture was sonicated for 10 minutes to ensure complete dissolution. The resulting solution was then transferred to a stainless-steel Parr autoclave and subjected to a reaction at 180 °C for 12 h. Afterward, the solution was cooled down to 30 °C at a rate of 10 °C/h to ensure a stable temperature reduction. Finally, the obtained crystals were washed three times with isopropanol to remove any residual reactants or adsorbed metal ions on the surface. The product was then dried at 60 °C for 24 h to yield the final product.

1.3 Characterization

Single-crystal X-ray diffraction (SCXRD) data is collected using a Bruker AXS diffractometer (equipped with Mo $K\alpha$ radiation). Powder X-ray diffraction (PXRD) analysis is performed on a Panalytical X'PERT Pro Powder X-ray diffractometer (equipped with Cu $K\alpha$ radiation). Simulated powder patterns are calculated by using VESTA software employing Crystallographic Information Files (CIF) from single crystal X-ray experiments. Energy dispersive spectrometry (EDS) is performed using an accessory for a ZEISS G500 scanning electron microscope. Thermogravimetric analysis (TGA) tests are performed using equipment (Perkin Elmer, TGA 400). Differential scanning calorimetry (DSC) measurements are performed using an instrument (STA 499 F5, Netzsch) with a heating rate of 10 K/min.

1.4 Spectral measurements

Steady-state excitation is performed using a 405 nm continuous wave (CW) laser (FN-360-20 mW, CNI laser) as the excitation source. Steady-state photoluminescence (PL) spectra are collected using a spectrometer (HR4000CG-UV-NIR, Ocean Optics). Higher TRPL dynamics were carried out by a time correlated single

photon counting (TCSPC) systems, which included a monochromator equipped with a detector (SPCM-01-20, Holita) and single photon counting electronics module (FLA-130, Holita) accounting for data acquisition. A laser (MDL-PS-405, CNI Laser), with a pulse width of 200 picosecond (ps) at 405 nm, served as the excitation and trigger source. Raman spectroscopy was performed at both room temperature and variable temperatures using a 671 nm laser for excitation. Temperature-dependent PL and Raman measurements were performed using a vacuum liquid-nitrogen cryostat (Cryo-77, Oriental Koji) with a range of 80-480 K and a temperature controller. Temperature-dependent PL measurements are performed using a vacuum liquid nitrogen cryostat (Cryo-77, Oriental Koji). PL emission and excitation spectra are measured by F-4600 fluorescence spectrophotometer.

2. Calculation method

We performed First-principles calculation on the $(\text{TEA})_2\text{SnCl}_6$ and $(\text{TEA})_2\text{SnCl}_6: 5\%\text{Te}$ structure using the Vienna Ab-initio Simulation Package (VASP)¹. The crystal structure visualization was presented with the help of VESTA software. During the simulations, the generalized gradient approximation (GGA) of Perdew-Burke-Ernzerhof (PBE) is used to describe the exchange-correlation functional and the choice is made to optimize the cell with an ultrasoft pseudopotential^{2,3}. A $4\times 2\times 4$ Monk horst Pack grid is set up to simulate the Brillouin zone, where the kinetic cut-off energy is 400 eV and the energy band structure is drawn along the high symmetry K point. The highly symmetrical K points are set to Γ -Z-D-B- Γ -A-E-Z for the calculated electronic energy band structure. The calculation converges the total energy to be lower than 1.0×10^{-5} eV per atom. The Hellmann-Feynman force on each atom was converged to lower than $0.01\text{eV}/\text{\AA}$.

Table S1 The result of ICP-OES measurements for (TEA)₂SnCl₆: x%Te MCs.

Te/Sn molar feed ratio	actual Sn	actual Te	actual Te-to-Sn
	concentration (mg/L)	concentration (mg/L)	molar ratio
0.001:0.999	8.2420	5.1840	0.0025%
0.005:0.995	7.9580	5.6900	0.0033%
0.01:0.99	8.4220	9.2970	0.0221%
0.05:0.95	8.5940	0.4748	0.0342%
0.1:0.9	7.9680	1.4520	0.5306%
0.2:0.8	6.2270	2.4450	1.1933%

Table S2 Crystal data and structure refinement for (TEA)₂SnCl₆

Compound	(C ₈ H ₂₀ N) ₂ SnCl ₆
Empirical formula	C ₁₆ H ₄₀ Cl ₆ N ₂ Sn
Formula weight	591.89
Temperature/K	150.00
Crystal system	monoclinic
Space group	C2/c
<i>a</i> /Å	13.9341(5)
<i>b</i> /Å	14.4459(4)
<i>c</i> /Å	12.8883(3)
<i>α</i> /°	90
<i>β</i> /°	91.4280(10)
<i>γ</i> /°	90
Volume/Å ³	2593.49(13)
<i>Z</i>	4
$\rho_{\text{calc}}/\text{cm}^3$	1.516
μ/mm^1	1.608
<i>F</i> (000)	1208.0
Crystal size/mm ³	0.2×0.15×0.1
Radiation	Mo <i>Kα</i> ($\lambda=0.71073$)

2θ range for data collection/ $^{\circ}$	4.062 to 52.796
Index ranges	$-17 \leq h \leq 17, -18 \leq k \leq 18, -15 \leq l \leq 16$
Reflections collected	25585
Independent reflections	2667 [$R_{\text{int}}=0.0325, R_{\text{sigma}}=0.0158$]
Data/restraints/parameters	2667/0/159
Goodness-of-fit on F^2	1.060
Final R_{indexes} [$I \geq 2\sigma(I)$]	$R_1=0.0209, wR_2=0.0522$
Final R_{indexes} [all data]	$R_1=0.0277, wR_2 = 0.0550$
Largest diff. peak/hole/ $e\text{\AA}^{-3}$	0.27/-0.35

Table 3 Comparison of performance parameters with other thermometric materials.

Material	Method	S_R (%K $^{-1}$)	S_A (K $^{-1}$)	Temperature (K)	Refs
Ba ₂ Y ₂ Ge ₄ O ₁₃ : Dy ³⁺ , Tm ³⁺	FIR	0.772 (298K)	0.641×10^{-2} (298 K)	298-473	4
Bi ₃ TeBO ₉ : Er ³⁺	FIR	1.02 (298K)	0.33 (473 K)	298-473	5
Na ₂ Y ₂ TeB ₂ O ₁₀ : Tb ³⁺	FIR	2.49 (475K)	2.16×10^{-2} (300 K)	300-475	6
