1. General Information

The required starting materials, thiols and catalyst were purchased from Sigma Aldrich, Avra and SRL were used without further purification. All other reagents and solvents were received from commercial suppliers and used without further purification. All reactions were performed in the round bottom flask using Digital Ultrasonic Cleaner (Helixs Bioscience Model; HBPS-20A) instrument. NMR spectra (¹H and ¹³C) of all compounds were recorded with CDCl₃ using 500 MHz and 400 MHz instrument Model: AV III, Make Bruker. Chemical shift of ¹H and ¹³C NMR were reported in parts per million from TMS at 0 ppm as the internal standard. Peak multiplicities are given as follow: s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; brs, broad singlet; dd, doublet of doublet, and so on. The coupling constants (*J* values) are given in Hz. IR spectra were recorded on Thermo Scientific Nicolet iS5; Frequencies are given in reciprocal centimeters (cm⁻¹) and only selected absorbance is reported. High-resolution mass spectra were recorded using 2% Water: IPA as mobile phase under (ESI+) condition with a QTOF and Agilent, advanced version LC-MS, QTOF.

The general synthesis method A and B applied for all thio-enols derivatives. The progress of the reaction mixture was monitored over silica gel 60 coated TLC plate (precoated F254 Merck plates) under UV lamp (254 nm) irradiation. All compounds were purified using 100-200 mesh size silica gel by column chromatography (ethyl acetate: Hexane).

2. General experimental procedure

General procedure (A) for the synthesis of compounds 4a to 4z

A 10 mL dry round bottom flask was charged with 1,3-dicarbonyl compound **1** (1.0 mmol), DMF-DMA (**2**) (1.0 mmol), and bismuth chloride (20 mol%). The mixture was sonicated (Frequency 40 kHz) at rt. The reaction progress was monitored by TLC (thin-layer chromatography). Then thiol **3** (1.1 mmol) was added and again reaction mixture was sonicated at rt. After the completion of the reaction, water was added, and the reaction mixture was extracted with ethyl acetate. The organic layer was washed with 0.1 N HCl aqueous solution, saturated sodium bicarbonate solution, brine, and water. The organic layer was dried over Na₂SO₄, filtered, and concentrated, and the crude product was subjected to column

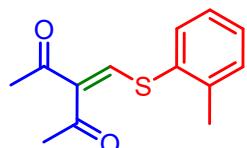

chromatography on silica gel (100-200 mesh size) with an ethyl acetate/hexane mixture to afford the pure product **4**.

General procedure (B) for the synthesis of compounds **6a to **6h**:**

To a 10 mL round bottom flask was added oxindole **5** (0.75 mmol), DMF-DMA (**2**) (1.5 mmol), and bismuth chloride (20 mol%) at rt. Then the mixture was sonicated at 40 °C. The progress of the reaction was monitored by TLC. Then thiol **3** (0.82 mmol) was added to the reaction mixture and again sonicated for the appropriate time (see Table 3) and was monitored by TLC. After completion of the reaction, dichloromethane was added filtered the crude reaction mixture to remove the bismuth chloride. The filtered residue was concentrated under reduced pressure and purified by column chromatography on silica gel (100-200 mesh size) using hexane and ethyl acetate (8.5:1.5) as an eluent to give the desired product.
