## Experimental Procedures

### Reagents

Cadmium fluoride ( $\text{CdF}_2$ , 99%, Adamas), Methyl nicotinate ( $\text{C}_7\text{H}_7\text{NO}_2$ , 99%, Adamas). They are all used without further purification.

### Synthesis

The compound  $\text{CdF}(\text{C}_6\text{H}_4\text{NO}_2)(\text{H}_2\text{O})$  was synthesized by hydrothermal.  $\text{C}_7\text{H}_7\text{NO}_2$  (0.274 g, 2 mmol),  $\text{CdF}_2$  (0.3 g, 2 mmol) and  $\text{H}_2\text{O}$  (3 mL) were added to the reaction kettle, the reaction kettle was warmed from room temperature 30 °C to 120 °C after 2 h. The reaction kettle was kept at 120 °C for 3 days and then cooled down for 2 days to 30 °C slowly at 3 °C/h to obtain white bulk crystals.

## Instruments and Property Characterizations

### Single Crystal X-ray Diffraction

The single-crystal *X*-ray diffraction (XRD) data for  $\text{CdF}(\text{C}_6\text{H}_4\text{NO}_2)(\text{H}_2\text{O})$  were collected on an XtaLAB Synergy R equipped with a graphite monochromator using  $\text{Mo K}\alpha$  radiation ( $\lambda = 0.71073 \text{ \AA}$ ) at 298 K. The crystal structure was solved by Direct Methods with Olex2 and refined by least-squares techniques on  $F^2$  with anisotropic thermal parameters for all atoms.<sup>1</sup> Atomic coordinates, equivalent isotropic displacement parameters, bond valence sum (BVS), selected bond lengths and angles, and hydrogen bond distances are listed in Tables S1 - S6.

### Powder X-ray Diffraction

Powder *X*-ray diffraction data were recorded on an Advance diffractometer at A temperature of 40 kV, 100 mA,  $\text{Cu K}\alpha 1$  radiation (Bruker D8, radiation wave number 1.5406 Å), scanning speed of 10 °/min, and scanning Angle range of 10-70°. The phase purity was determined by powder *X*-ray diffraction.

### Infrared (IR) Spectrum

The IR spectra was collected on a Nicolet iS5 Fourier-transformed infrared (FTIR) spectrometer at room temperature (4000-400  $\text{cm}^{-1}$ ). The sample and dry KBr are mixed and ground in a certain proportion and pressed into flakes for measurement. (weight ratio = 1:100).

### **UV-vis Diffuse Reflectance Spectroscopy**

The UV-vis diffuse reflectance spectra were obtained by using a Varian Cary 5000 spectrophotometer with a scan range of 200-800 nm at room temperature. The spectrally pure barium sulfate was selected as a reference (100% reflectance), and a ground powder sample was coated on its surface for testing.

### **Thermogravimetric (TG) Analysis**

Thermogravimetric analysis (TGA) was carried out using a Netzsch STA 449 F5 analyzer. The specific method is to weigh a sample of about 6 mg and place it in a platinum crucible, heat it from room temperature to 800 °C at a rate of 10 K min<sup>-1</sup> in a N<sub>2</sub> gas atmosphere.

### **X-ray Photoelectron Spectroscopy**

X-ray photoelectron spectroscopy (XPS) measurement was performed with a AXIS SUPRA+ spectrophotometer.

### **Second Harmonic Generation (SHG) Measurement**

The second-order NLO measurements of the powder samples were performed at room temperature, and the SHG effect of the powder samples was measured using a Q-switched 1064 nm Nd: YAG laser by using the improved Kurtz and Perry methods. Polycrystalline samples of this compound were sieved into different particle sizes (35-50, 50-74, 74-100, 100-154, 154-180, 180-280 and 280-450 μm) to investigate whether its SHG response could be phase matched. The reference substance KH<sub>2</sub>PO<sub>4</sub> (KDP) was selected to compare with the SHG efficiency of the sample, so as to evaluate the second-order NLO effect of the measured sample.

### **Birefringence Measurements**

The birefringence of crystalline CdF(C<sub>6</sub>H<sub>4</sub>NO<sub>2</sub>)(H<sub>2</sub>O) was assessed with a polarizing microscope (ZEISS Axioscope A1) equipped with a Berek compensator. The wavelength of the light source was 546 nm. The birefringence were calculated according to the following equation:  $\Delta R$  (retardation) =  $|N_s - N_o| \times T = \Delta n \times T$  where  $\Delta R$  denotes the optical path difference,  $\Delta n$  represents the birefringence, and  $T$  is the thickness of the crystal.<sup>2</sup> The positive and negative rotation of compensation affords the relative retardation. The clear boundaries between the first, second, and third-order interference colors result in a small relative error. To improve the accuracy of the

birefringence, transparent regular plate-like CdF(C<sub>6</sub>H<sub>4</sub>NO<sub>2</sub>)(H<sub>2</sub>O) crystals were chosen for the measurements.

### **Computational Methods**

The first-principle calculation of CdF(C<sub>6</sub>H<sub>4</sub>NO<sub>2</sub>)(H<sub>2</sub>O) is based on the CASTEP module of Materials Studio software package, and the geometric structure optimization of the system is carried out by density functional theory.<sup>3</sup> The exchange correlation functional is described by the generalized gradient approximation GGA-PBE.<sup>4</sup> the truncation energy is set to 940 eV, and the Monkhorst-Pack<sup>5</sup>  $k$  point grid  $3 \times 6 \times 2$  is selected in the first Brillouin region to ensure the accuracy of the calculation results. Self-consistent iterative convergence (SCF) is  $5.0 \times 10^{-7}$  eV atom<sup>-1</sup>, the maximum displacement convergence is  $5.0 \times 10^{-4}$  Å, the internal stress is 0.02 GPa, the force on the atom is 0.01 eV Å<sup>-1</sup>, and the energy convergence is within  $5.0 \times 10^{-6}$  eV atom<sup>-1</sup>. The ion-electron interactions of all atoms are modeled by the ultra-soft pseudopotential, and the atomic electron configurations are C( $2s^2 2p^2$ ), H( $1s^1$ ), N( $2s^2 2p^3$ ), O( $2s^2 2p^4$ ), Cd( $5s^2 4d^{10}$ ), F( $2s^2 2p^5$ ). The SHG coefficients  $d_{ij}$  were calculated through the “velocity-gauge” formula.<sup>6,7</sup>

## Results and Discussion

**Table S1.** Crystal data and structure refinement for CdF(C<sub>6</sub>H<sub>4</sub>NO<sub>2</sub>)(H<sub>2</sub>O).

| Compound   | CdF(C <sub>6</sub> H <sub>4</sub> NO <sub>2</sub> )(H <sub>2</sub> O) |
