Supplemental Fig. 1 Effect of pre-treatment duration. Cells were pre-treated with static culture for 1, 2, or 3 days. All experimental samples were then exposed to 15 dyne/cm² of shear stress for one day and assessed for gene expression (M / M GAPDH) of OCT4 (A), T-BRACHY (B), AFP (C), and NES (D). Data is presented as relative fold regulation between experimental and matched static controls, where upregulation (Shear/Static>1) is represented by black bars and downregulation (Static/Shear>1) is represented by white bars. A ratio of 1 represents no change between groups. Data presented are averages (mean \pm SEM; n = total of 9-12 replicates from 3 or 4 independent trials) where asterisks indicate a significant p<0.05) difference between experimental and control groups.
