1. Experimental

Materials and Instruments: All the solvent and chemicals were purchased from Shanghai Chemical Reagent Co. Ltd. (China) and were used as received unless stated otherwise. The synthesis procedures, chemical and spectroscopic characterization and microscopic imaging of HepG2 cells were described in the corresponding main text. For single-photon spectroscopic experiments in toluene and CHCl₃, the concentrations are 1×10⁻⁵ mol l⁻¹ and 1×10⁻⁶ mol l⁻¹ for absorption and fluorescent emission spectra, respectively. For the single-photon absorption and single-photon fluorescence emission experiments in PBS buffer, the concentrations are both 1×10⁻⁵ mol l⁻¹. The two-photon fluorescence spectra and two-photon absorption cross-sections of all molecules studied were obtained by comparison the 2PF emission with fluorescein calibration standard (both at the concentration of 5 × 10⁻⁴ mol.l⁻¹).
