## I. Melting studies

<sup>20</sup> The melting curves (absorbance *versus* temperature) were recorded at 260 nm on a UV–Visible spectrophotometer equipped with a temperature controller. The melting experiments were carried out by mixing the equimolar amount of two oligonucleotide strands in a solution of sodium phosphate buffer (10 mM; pH=7.0) containing EDTA (1 mM) and NaCl (100 mM). The ODN concentration was kept at 12  $\mu$ M. The absorbance was recorded in the temperature range of 10–80  $^{\circ}$ C at a sweep rate of 1  $^{\circ}$ C  $\text{min}^{-1}$ . All experiments were done in triplicate. The respective melting temperatures obtained are collected below in Table 1.

**Table 1.** Melting temperature of the duplex formed by the unmodified ODN and conjugate with the complementary sequence<sup>a</sup>.

Oligonucleotides	$T_m \pm 0.5$ $^{\circ}$ C
Unmodified 11-mer + complementary sequence	61.0
Conjugate <b>4</b> + complementary sequence	62.1

<sup>a</sup> The ODN sequence is 5'-CGCACACACGC-3' and the complementary sequence is 5'-GCGTGTGTGCG-3'.

## II. Circular dichroism (CD) studies

The CD experiments were carried out by mixing the equimolar amount of two-oligonucleotide strands in a 10 mM sodium phosphate buffer (pH = 7.0) containing EDTA (1mM) and NaCl (100 mM). The ODN concentration was kept at 12  $\mu$ M.

**Fig 1.** CD spectra for the duplexes formed by unmodified 11-mer oligonucleotide (A) and peptide–oligonucleotide conjugate **4** (B) with the complementary sequence.

## VI. Spectroscopic characterisation data for RGD peptide-linker conjugate 6 (Boc Protected)

Fig 11. ESIMS (positive mode) of crude RGD peptide-linker conjugate 6 ( $m/z$ : calcd = 1000.1).

## VII. Spectroscopic characterisation data for RGD peptide-linker conjugate 7 (Boc free)

Fig 12. RP-HPLC profile ( $\lambda_{\text{abs}} = 700\text{nm}$ ) of purified RGD peptide-linker conjugate 7.

Fig 13. ESIMS (positive mode) of purified RGD peptide 7 ( $m/z$ : calcd = 899.0).

### VIII. Spectroscopic characterisation data for oligonucleotide 3'-aldehyde **8**

Fig 14. RP-HPLC ( $\lambda_{\text{abs}} = 260 \text{ nm}$ ) of purified oligonucleotide 3'-aldehyde **8**.

Fig 15. ESIMS (negative mode) of purified oligonucleotide 3'-aldehyde **8** ( $m/z$ : calcd = 3392.2).

## IX. Spectroscopic characterisation data for free aminoxy linker 9

Fig 16. RP-HPLC profile ( $\lambda_{\text{abs}} = 250 \text{ nm}$ ) of crude free aminoxy linker 9.

Fig 17. ESIMS (negative mode) of crude free aminoxy linker 9 ( $m/z$ : calcd = 347.4).

## X. Spectroscopic characterisation data for oligonucleotide–linker conjugate **10**

Fig 18. RP-HPLC profile ( $\lambda_{\text{abs}} = 260$  and 400 nm) of purified oligonucleotide–linker conjugate **10**.

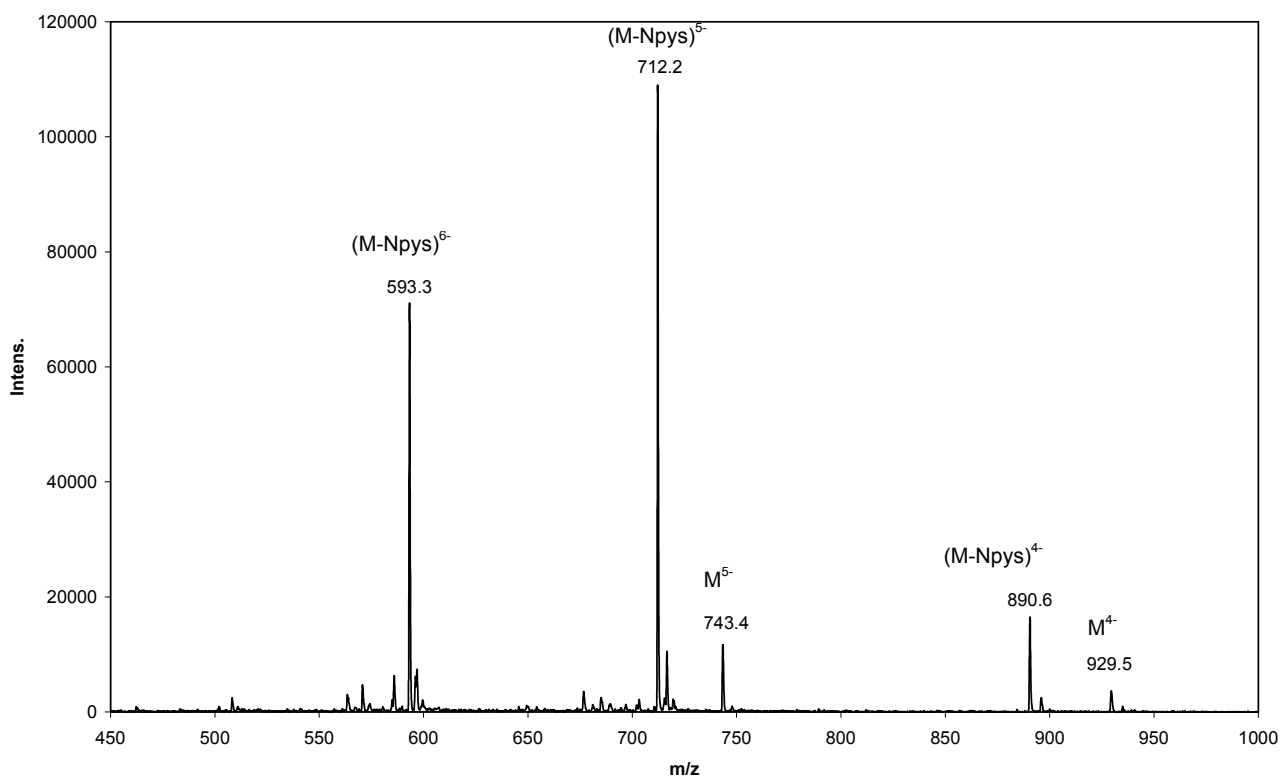

Fig 19. ESIMS (negative mode) of purified oligonucleotide–linker conjugate **10** ( $m/z$ : calcd = 3722.6).

## XI. DTT treatment<sup>1</sup> of oligonucleotide–linker conjugate **10**

Oligonucleotide–linker conjugate **10** (10 nmol, 35  $\mu$ L) was suspended in a solution of DTT (10 mM) and the reaction was followed by RP-HPLC. Complete dispartition of the peak corresponding to the NPys protection was observed after a night's  
90 reaction. The chromatogram recorded after 15 min of reaction shows that peaks corresponding to Npys protected (RT = 13.1 min) and unprotected (RT = 11.9 min) oligonucleotide–linker conjugates are well resolved and hence must not have been collected together during the HPLC purification of the conjugate **10**. The NPys loss observed during the ESIMS analysis of the conjugate therefore must be due to the triethylamine solution added during the mass analysis.

**Fig 20.** RP-HPLC profile ( $\lambda_{\text{abs}} = 260$  nm) of purified oligonucleotide–linker conjugate **10** during the DTT treatment. (A) before treatment; (B) after 15 min of treatment and (C) overnight treatment.
