## 2) An alternative mechanism for the formation of guanidines

Zn(OTf)<sub>2</sub> acted as Lewis acid catalyst to activate a carbodiimide yielding the intermediate  $\text{RN}^{\oplus}\equiv\text{C}-\text{NR}-\text{Zn}^{\ominus}(\text{OTf})_2$  (**E**). Nucleophilic addition of an amine to **E** and proton transfer gave rise to the guanidine and regenerated Zn(OTf)<sub>2</sub>. see: N. Yamamoto and M. Isobe, *Chem. Lett.*, 1994, 2299–2302.

## 3) X-ray crystallographic studies for **20** and **22**

Crystals for X-ray analyses of **20** and **22** were obtained as described in the preparations. Data collections were performed at  $-100\text{ }^{\circ}\text{C}$  on a Rigaku SATURN 724+ CCD diffractometer, using graphite-monochromated Mo  $\text{K}\alpha$  radiation ( $\lambda = 0.71073\text{ \AA}$ ). The determination of crystal class and unit cell parameters was carried out by the CrystalClear (Rigaku Inc., 2008) program package. The raw frame data were processed using the CrystalClear (Rigaku Inc., 2008) to yield the reflection data file. The structure was solved by use of SHELXTL program. Refinement was performed on  $F^2$  anisotropically for all the non-hydrogen atoms by the full-matrix least-squares method. The hydrogen atoms were placed at the calculated positions and were included in the structure calculation without further refinement of the parameters. Crystal data, data collection and processing parameters for **20** and **22** were given only in Supporting Information. Crystallographic data (excluding structure factors) have been deposited with the Cambridge Crystallographic Data Centre as supplementary publication nos. CCDC-741356 (**20**), and CCDC-741355 (**22**). Copies of these data can be obtained free of charge from the Cambridge Crystallographic Data Centre via [www.ccdc.cam.ac.uk/data\\_request/cif](http://www.ccdc.cam.ac.uk/data_request/cif).
