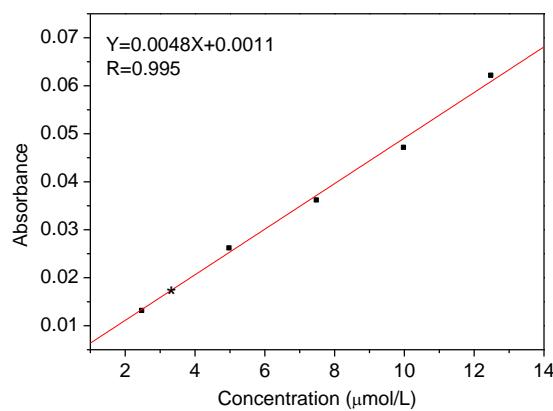

Figure S1. Absorbance of PZQ-5 in pure water. Absorbance = 0.018, Concentration = 3.52 μmol/L.

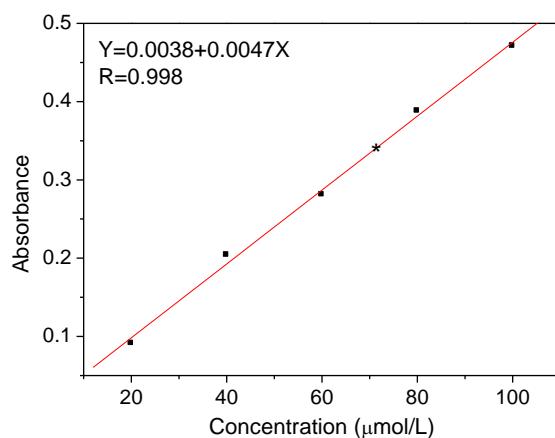

Figure S2. Absorbance of PZQ-5 in DMSO: PBS = 1:399. Absorbance = 0.342, Concentration = 71.96 μmol/L.

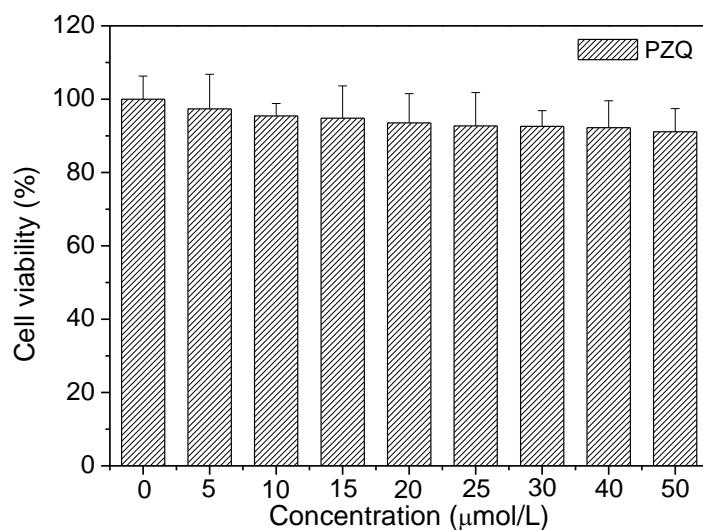

Figure S3. Cell survival viability detected by MTT method: HeLa cells incubated with the presence of 5~50 $\mu\text{mol/L}$ PZQ for 24 h.

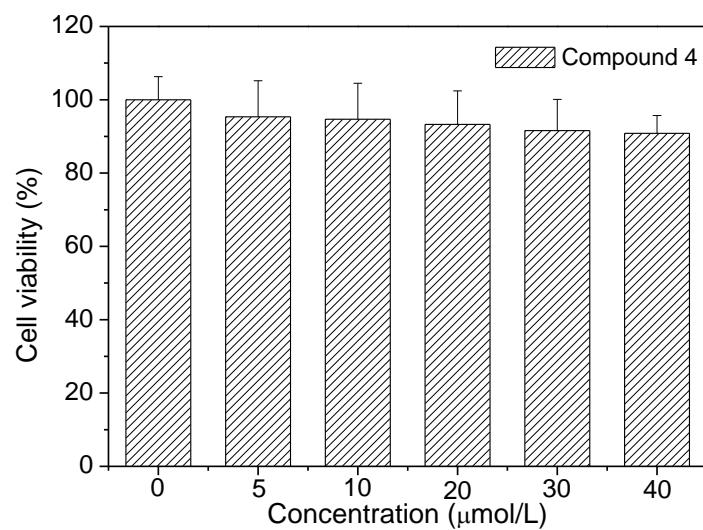

Figure S4. Cell survival viability detected by MTT method: HeLa cells incubated with the presence of 5~40 $\mu\text{mol/L}$ compound 4 for 24 h.

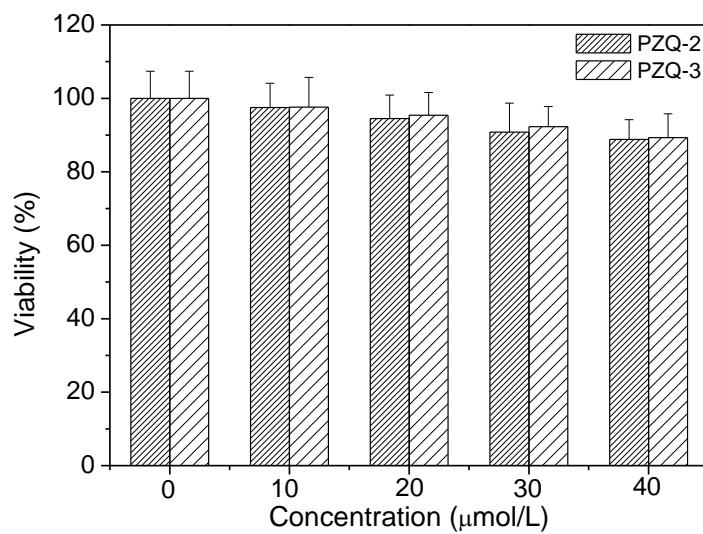

Figure S5. Cell viability (%) estimated by MTT proliferation test versus incubation concentrations of PZQ-2 and PZQ-3. HeLa cells were cultured in the presence of 0 ~ 40 $\mu\text{mol/L}$ PZQ-2 and PZQ-3 at 37 °C for 24 h.

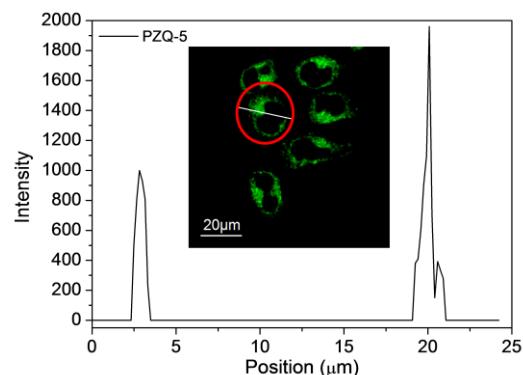

Figure S6. The fluorescence intensity profile and fluorescence image (across the line) of HeLa cells incubated with PZQ-5.
