## 1. General

<sup>1</sup>H and <sup>13</sup>C NMR spectra were recorded in CDCl<sub>3</sub> at 30 °C. The chemical shifts were referenced to the residual solvent protons in the <sup>1</sup>H NMR (7.26 ppm) and in the <sup>13</sup>C NMR (77.0 ppm). Mass spectral analyses were performed with EI or FAB mode. IR spectra were recorded as a KBr disk. Melting points were measured with a hot-stage apparatus equipped with a thermometer. Column chromatography and TLC were performed with silica gel (70-230 mesh) and precoated silica gel plates, respectively. Preparative recycling GPC separation was undertaken using two 600 mm × 20 mm GPC columns with CHCl<sub>3</sub> as the eluent. All reagents were obtained from commercial suppliers and used as received. Solvents were dried (drying agent in parentheses) and distilled prior to use: Et<sub>3</sub>N (KOH), benzene (CaH<sub>2</sub>), pyridine (KOH).

UV-vis spectra and fluorescence spectra were measured in spectrograde dichloromethane. Electrochemical measurements were performed in degassed CH<sub>2</sub>Cl<sub>2</sub> including *n*-Bu<sub>4</sub>NClO<sub>4</sub> as supporting electrolyte. Glassy carbon was used as the working electrode. The counter electrode was platinum wire, and reference electrode was Ag/Ag<sup>+</sup>. The potential was corrected against ferrocene (Fc)/ferrocenium (Fc<sup>+</sup>) redox couple. Cyclic voltammetry (CV) was performed at a scan rate of 100 mV/s.

A single crystal of **2b** suitable for X-ray diffraction study was subjected to data collection which was conducted with a Rigaku IP detector with graphite monochromated MoK $\alpha$  radiation. The positional and thermal parameters of non-hydrogen atoms were refined anisotropically on F2 by the full-matrix least-squares method using SHELXL-97.<sup>1</sup> Hydrogen atoms were placed at calculated positions and refined "riding" on their corresponding carbon atoms. In the subsequent refinement, the function  $\Sigma w(Fo^2 - Fc^2)^2$  was minimized, where |Fo| and |Fc| are the observed and calculated structure factor amplitudes, respectively. The agreement indices are defined as R1 =  $\Sigma (|Fo| - |Fc|)/\Sigma |Fo|$  and wR2 =  $[\Sigma w (Fo^2 - Fc^2)^2 / \Sigma (wFo^2)^2]^{1/2}$ .

The DFT calculations were performed with a Gaussian 09 program package.<sup>2</sup> The geometries of the molecules were optimized by using the B3LYP method with the 6-31G(d) basis set. The nature of the stationary points was assessed by means of vibrational frequency analysis.

### 3. Reaction of diiodozethrene **4b** with IBr

Respective amount of IBr (Table below) in  $\text{CHCl}_3$  was added to **4b** under argon and the mixture was stirred at room temperature for 2 h. After the mixture was diluted by  $\text{CHCl}_3$  it was washed with saturated aqueous  $\text{Na}_2\text{S}_2\text{O}_3$  solution. The aqueous layer was extracted with  $\text{CHCl}_3$  twice. The combined organic layer was dried over  $\text{MgSO}_4$  and the solvent was removed under reduced pressure.  $^1\text{H}$  NMR spectrum of this product exhibited signals assigned to **4b**, **4c** and **4d** from which the relative ratio was determined (Figure S1). Mass spectrum (LDI-TOF) also exhibited molecular ion peak at  $m/z$  731.04 corresponding to  $\text{C}_{40}\text{H}_{44}\text{BrI}^+$ .

amount of <b>4b</b> used / mg ( $\mu\text{mol}$ )	amount of IBr used / mg ( $\mu\text{mol}$ )	amount and ratio of products <b>4b</b> , <b>4c</b> and <b>4d</b> obtained / mg
4.3 (5.5)	0.57 (2.7)	3.9; <b>4b</b> : <b>4c</b> : <b>4d</b> = 1 : 0.1 : 0.5
18.6 (23.9)	4.2 (0.73)	16.5; <b>4b</b> : <b>4c</b> : <b>4d</b> = 1 : 0.7 : 1.3
40.0 (51.4)	12.8 (61.7)	34.3; <b>4b</b> : <b>4c</b> : <b>4d</b> = 1 : 2.6 : 2

The ratio of **4b**, **4c** and **4d** was estimated from the integrated area of signals at  $\delta$  8.53 (**4b**), 8.64 (**4c**) and 8.62 (**4d**) in the  $^1\text{H}$  NMR spectrum.

#### 5. Fluorescence spectra of **2a** and **2b**

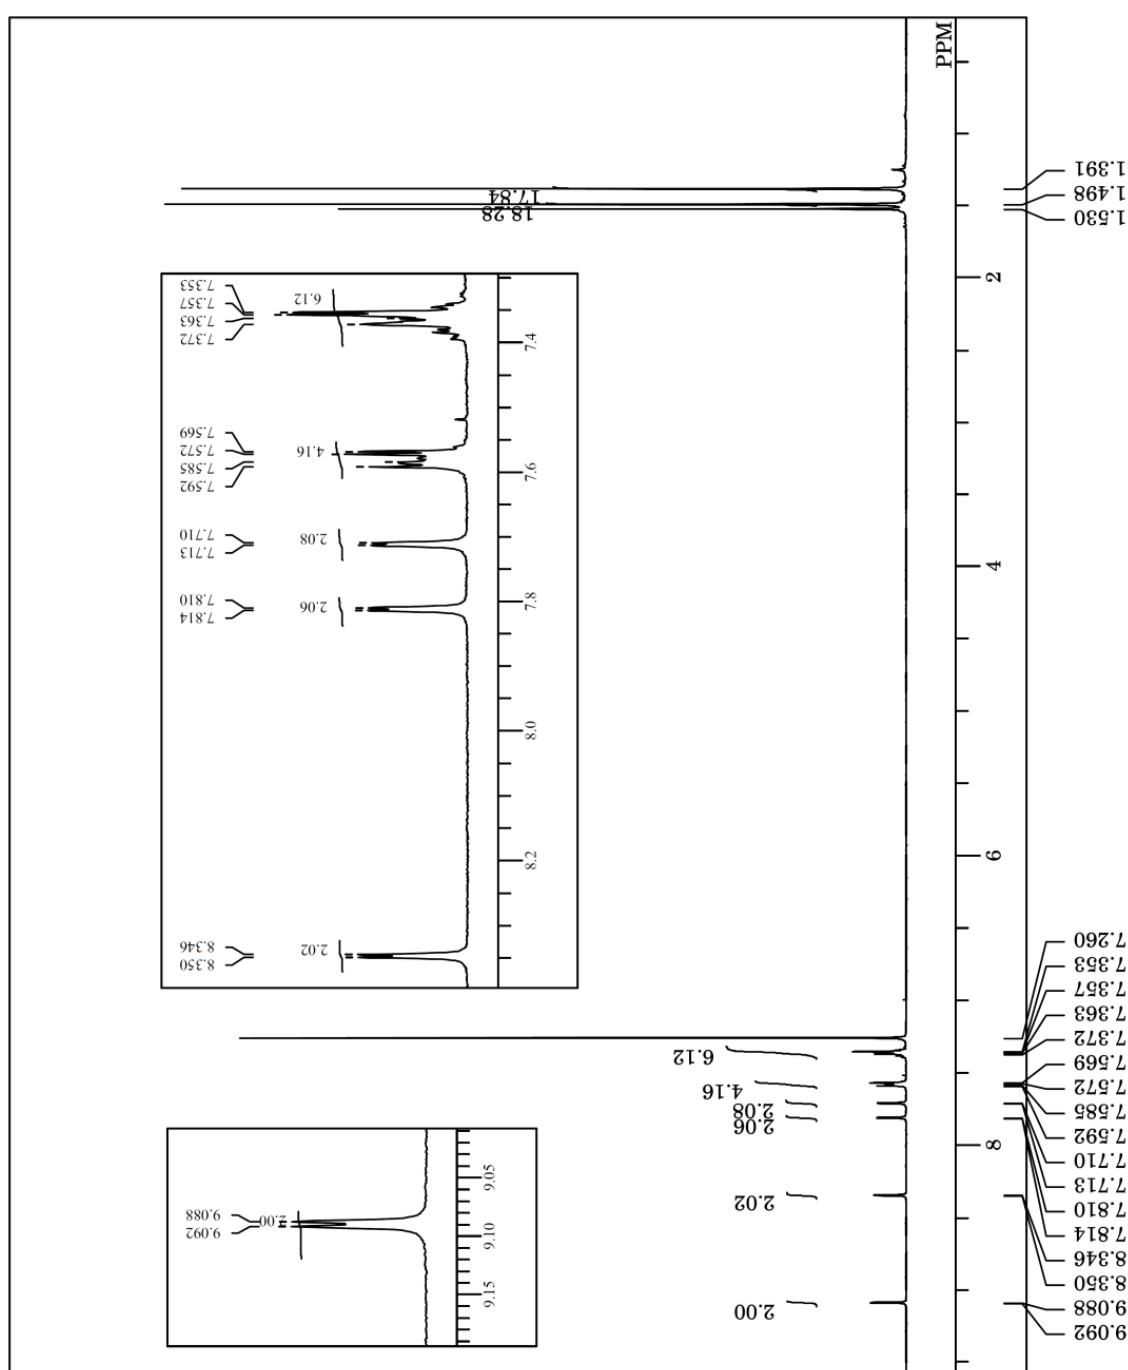

Compounds **2a** and **2b** exhibited fluorescence emission at 619 nm ( $\lambda_{\text{ex}} = 545$  nm,  $\Phi = 0.05$ ) and 649 nm ( $\lambda_{\text{ex}} = 500$  nm  $\Phi = 0.05$ ), respectively, whereas **2c** and **2d** did not. Measurements were performed with  $5.36 \times 10^{-6}$  M solution for **2a** and  $8.73 \times 10^{-6}$  M solution for **2b** under air without degassing. Quantum yields were determined relative to rohdamine B in EtOH ( $\Phi = 0.70$ ).<sup>6</sup>
