1. Materials and Methods:

1^{S1} and **2**^{S2} were synthesized according to literature procedures. All reagents were commercially available and used as supplied without further purification. Solvents were either employed as purchased or dried according to procedures described in the literature. NMR spectra were recorded with a Bruker Advance DMX 400 spectrophotometer with use of the deuterated solvent as the lock and TMS as the internal reference. Low-resolution electrospray ionization (LRESI) mass spectra were obtained on a Bruker Esquire 3000 plus mass spectrometer (Bruker-Franzen Analytik GmbH Bremen, Germany) equipped with an ESI interface and an ion trap analyzer. High-resolution mass spectrometry experiments were performed with a Bruker Daltonics Apex III spectrometer or with a Bruker 7-Tesla FT-ICR mass spectrometer equipped with an electrospray source (Billerica, MA, USA). The melting points were collected on a SHPSIC WRS-2 automatic melting point apparatus.

2. Synthesis of **3**

Scheme S1. Synthesis of **3**.

A solution of **2** (1.00 g, 1.44 mmol) in acetonitrile (150 mL) was stirred in a 250 mL round-bottom flask, then potassium carbonate (2.01 g, 1.45 mmol) and methyl chloroacetate (1.56 g, 1.44 mmol) were added to the solution. The mixture was stirred under an atmosphere of nitrogen at reflux (83 °C) for 24 h. After the solid was filtered off, the solvent was removed. The residue was purified by column chromatography (eluent: petroleum ether/dichloromethane 3:1 → 0:1) to give **3** as a white solid (0.62 g, 44%). **3** M.p. 185.1–186.3 °C. The ¹H NMR spectrum of **3** is shown in Figure S1. ¹H NMR (400 MHz, CDCl_3 , room temperature) δ (ppm): 6.85 (s, 2H), 6.83 (d, 4H), 6.71 (d, 4H), 4.53 (s, 4H), 4.52 (s, 4H), 3.77–3.79 (m, 10H), 3.73 (s, 6H), 3.70 (s, 6H), 3.66 (s, 6H), 3.32 (s, 6H), 3.12 (s, 6H).
