Determination of drug loading capacity:

The drug loading capacity was estimated by TG analysis of the as-prepared Tb–CaP nanoparticles without and with docetaxel loading (Figure 5a). The drug loading capacity (y) was calculated according to the following formula:

$$y = \frac{\Delta W2 - \Delta W1}{1 - \Delta W2} \times 100 \%$$

The $\Delta W1$ (14.6 %) and $\Delta W2$ (22 %) are the weight loss of Tb–CaP nanoparticles without and with docetaxel loading, respectively. Therefore, the docetaxel loaded in the Tb–CaP nanoparticles is calculated to be about 95 mg g⁻¹ (mg drug per gram of the carrier).

Figure S1. Size distributions of the as-prepared undoped CaP nanoparticles (a) and Tb-CaP nanoparticles (b) dispersed in ethanol measured by dynamic light scattering (DLS).

Figure S2. TEM micrographs of undoped CaP nanoparticles prepared in the absence of mPEG-PLA.

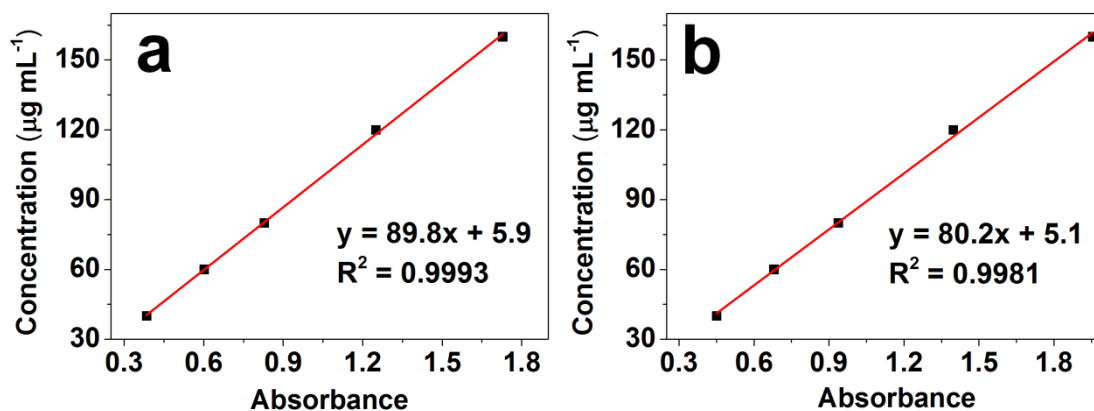

Figure S3. The calibration curves measured in PBS solutions with different pH values of 4.5 (a) and 7.4 (b) used for the quantification of docetaxel release by the UV-vis absorption analysis.

Figure S4. The cumulative docetaxel drug release percentage versus square root of release time for docetaxel-loaded Tb-CaP nanoparticles in PBS with different pH values of 4.5 and 7.4.
