# 1. <sup>1</sup>H NMR spectrum of PTC (400 MHz, CDCl<sub>3</sub>):

Figure S1: <sup>1</sup>H NMR spectrum of PTC in CDCl<sub>3</sub> solution.

# 2. <sup>13</sup>C NMR spectrum of PTC (400 MHz, d<sub>6</sub>-DMSO):

**Figure S2:** <sup>13</sup>C NMR spectrum of **PTC** in d<sub>6</sub>-DMSO solution.

# 3. TOF MS ES+ Mass Spectrum of PTC:

Figure S3: Mass spectrum of PTC.

4. <sup>1</sup>H NMR spectrum of PTC+SnCl<sub>4</sub>.5H<sub>2</sub>O (2-equivalent) +Na<sub>2</sub>S (2-equivalent) in CDCl<sub>3</sub> solution:

Figure S4: <sup>1</sup>H NMR spectrum of PTC+SnCl<sub>4</sub>.5H<sub>2</sub>O+Na<sub>2</sub>S in CDCl<sub>3</sub> solution.

# 5. TOF MS ES+ Mass Spectrum of PTC in the presence SnCl<sub>4</sub>.5H<sub>2</sub>O:

Figure S5: TOF MS ES+ Mass spectrum spectrum of PTC+Sn<sup>4+</sup>.

# 6. TOF MS ES+ Mass spectrum of PTC+SnCl<sub>4</sub>.5H<sub>2</sub>O+Na<sub>2</sub>S:

**Figure S6:** TOF MS ES+ Mass spectrum spectrum of  $PTC+Sn^{4+}+S^{2-}$ .

7. Job's plot for determining the stoichiometry of sensor PTC and  $Sn^{4+}$  ion by fluorescence method:

**Figure S7:** Job's plot of sensor **PTC** and  $Sn^{4+}$  ion by fluorescence method.

# 8. Visual and fluorescence photographic image of PTC in presence of different metal ions:

**Figure S8:** The Visible color (top) and fluorescence changes (buttom) of receptor **PTC** in EtOH–H<sub>2</sub>O solution (EtOH :  $H_2O = 4 : 1$ , v/v, 10 mM HEPES buffer, pH = 7.4) upon addition of various metal ions.

#### 9. Fluorescence Bar Diagram of PTC in presence of various metal ions:

**Figure S9:** Relative fluorescence changes (at 386 nm) of **PTC** ( $c = 4 \times 10^{-5}$  M), EtOH / H<sub>2</sub>O = 4 : 1, v/v, 10 mM HEPES buffer, pH = 7.4) with respective metal cations ( $c = 2 \times 10^{-4}$  M, left to right- PTC, Pb<sup>2+</sup>, Mg<sup>2+</sup>, Ca<sup>2+</sup>, Al<sup>3+</sup>, Hg<sup>2+</sup>, Sn<sup>4+</sup>, Co<sup>2+</sup>, Ni<sup>2+</sup>, Cu<sup>2+</sup>, Cr<sup>3+</sup>, Cd<sup>2+</sup>, Zn<sup>2+</sup>, Mn<sup>2+</sup>, Ag<sup>+</sup>, Fe<sup>2+</sup>, Fe<sup>3+</sup>. Fluorescence photograph of **PTC** and **PTC**+Sn<sup>4+</sup>.

10. Evaluation of the Association Constant for the Formation of  $PTC \cdot Sn^{4+}$ . Receptor PTC with an effective concentration of  $4 \times 10^{-5}$  M in EtOH/H<sub>2</sub>O solution (EtOH : H<sub>2</sub>O = 4 :1, v/v, 10 mM HEPES buffer, pH = 7.4) was used for the emission titration studies with a Sn<sup>4+</sup> solution. A stock solution of SnCl<sub>4.5</sub>H<sub>2</sub>O, having a concentration of  $2 \times 10^{-4}$  M in an aqueous HEPES buffer (4:1, v/v; pH 7.4) solution, was used.

Calculations for the Binding Constants Using Spectrophotometric Titration Data. The association constant and stoichiometry for the formation of the respective complexes were evaluated using the Benesi–Hildebrand (B-H) plot (eq 1).<sup>1</sup>

$$1/(I - I_0) = 1/K(I_{max} - I_0)[M^{n+}] + 1/(I_{max} - I_0)$$
(1)

Here I<sub>0</sub>, I<sub>max</sub>, and I represent the emission intensity of free **PTC**, the maximum emission intensity observed in the presence of added metal ion at 386 nm, 402 nm, 485 nm for Sn<sup>4+</sup> ( $\lambda_{ext}$  = 344 nm), and the emission intensity at a certain concentration of the metal ion added, respectively.

10A. Association constant calculation graph (Absorption method):

**Figure S10A:** Bensei-Hildebrand plot obtained from absorption method (Excitation calculated from 344 nm) studies. Binding constant ( $K_a = 2.22 \times 10^4 \text{ M}^{-1}$ ) curve of sensor **PTC** with Sn<sup>4+</sup>determined by UV-Absorbance method.

10B. Association constant calculation graph (Fluorescence method):

**Figure S10B**: Bensei-Hildebrand plot obtained from the Fluorescence (emmission calculated from 386 nm) studies. Binding constant (Ka =  $4.86 \times 10^4$  M<sup>-1</sup>) curve of sensor **PTC** with Sn<sup>4+</sup>determined by fluorescence method.

#### **11. Calculations for detection limit (Fluorescence method):**

The detection limit (DL) of **PTC** for  $Sn^{4+}$  was determined from the following equation<sup>2</sup>: DL = K\* Sb1/S

Where K = 2 or 3 (we take 3 in this case); Sb1 is the standard deviation of the blank solution; S is the slope of the calibration curve.

**Figure S11.** Calibration curve for fluorescence titration of **PTC** with Sn<sup>4+</sup>. From the graph we get slope (S) =  $6 \times 10^6$ . Standard deviation (Sb1=13.85817) Thus using the formula we get the detection limit = 6.93 µM.

## 12. Reversibility Study:

**Figure S12:** Change in fluorescence spectra of PTC-Sn<sup>4+</sup> complex (c =4 × 10<sup>-5</sup> M) in EtOH– H<sub>2</sub>O solution (EtOH : H<sub>2</sub>O = 4 : 1, v/v, 10 mM HEPES buffer, pH = 7.4) upon addition of Na<sub>2</sub>EDTA (c =  $2 \times 10^{-4}$  M).

#### 13. Cytotoxicity Assay:

**Figure S13:** MTT assay to determine the cytotoxic effect of **PTC** and **PTC**–Sn complex on Vero 76 cells.

#### 14. Computational Method:

Geometries have been optimized in B3LYP density functional method with 6-31G basis set for all atom excluding 6-31G\* for sulphur and Lanl2dz for Sn. The geometries are verified as proper minima or not by frequency calculations. Time-dependent density functional theory calculation has also been performed at the same level of theory.

Selected electronic excitation energies (eV), oscillator strengths (f), main configurations, and CI Coefficients of the low-lying excited states of CS1 and all the complexes. The data were calculated by TDDFT//B3LYP/6-31+G(d) based on the optimized ground state geometries.

Molecules	Electronic	Excitation	$f^{b}$	Composition <sup>c</sup>	(composition)
	Transition	Energy <sup>a</sup>			%
PTC					
	$S_0 \rightarrow S_1$	3.3399 eV (371nm)	0.4119	$H \rightarrow L$	91.6
				$\text{H-1} \rightarrow \text{L}$	
	$S_0 \rightarrow S_{15}$	5.3341 eV (232 nm)	0.3060	$H-2 \rightarrow L+3$	40.5
				$H-3 \rightarrow L+1$	
	$S_0 \rightarrow S_{18}$	5.5644 eV (222 nm)	0.4839	$H-3 \rightarrow L+1$	65.3
				$H-3 \rightarrow L+2$	
		6.4775 eV (191 nm)	0.2809	$H-4 \rightarrow L+3$	48.44
<b>PTC-</b> Sn <sup>4+</sup>					
	$S_0 \rightarrow S_{18}$	3.0913 eV (401 nm)	0.4934	$H \rightarrow L + 7$	68.5
				$H \rightarrow L + 4$	

[a] Only selected excited states were considered. The numbers in parentheses are the excitation energy in wavelength. [b] Oscillator strength (only the f > 0.25 was considered). [c] H stands for HOMO and L stands for LUMO.

Species	E(HOMO)	E(LUMO)	ΔΕ	ΔΕ

#### 15. X-ray crystallography study:

X-ray diffraction data of single crystals of **PTC** (with dimensions of  $0.315 \times 0.380 \times 0.603$  mm) was collected using Bruker APEX II Duo CCD area-detector diffractometer operating at 50kV and 30mA using Mo K $\alpha$  radiation ( $\lambda = 0.71073$  Å). Data collection and reduction were performed using the APEX2 and SAINT software.<sup>3</sup> The SADABS software was used for absorption correction. **PTC** was solved by direct method and refinement was carried out by the full-matrix least-squares technique on F<sup>2</sup> using SHELXTL package.<sup>4</sup> All non-hydrogen atoms were refined anisotropically whereas hydrogen atoms were refined using a riding model with U<sub>iso</sub>(H) = 1.2 U<sub>eq</sub> (N) [N—H = 0.8528 and 0.9053 Å]. The remaining H atoms were placed in calculated positions with C—H = 0.93 Å after checking their positions in the Fourier difference map. The U<sub>iso</sub> values were constrained to be 1.2 U<sub>eq</sub> of the carrier atom. The crystallographic data and hydrogen bonds geometry for **PTC** is presented in Table 1. Crystallographic data for **PTC** have been deposited with the Cambridge Crystallographic Data Center CCDC **1011198.**

#### 16. Calculation of quantum yield:

Here, the quantum yield  $\phi$  was measured by using the following equation<sup>5</sup>:

$$\phi_{x} = \phi_{s} (F_{x} / F_{s}) (A_{s} / A_{x}) (n_{x}^{2} / n_{s}^{2})$$

Where,

X & S indicate the unknown and standard solution respectively,  $\phi =$  quantum yield,

F = area under the emission curve, A = absorbance at the excitation wave length,

n = index of refraction of the solvent. Here  $\phi$  measurements were performed using anthracene in ethanol as standard [ $\phi = 0.28$ ]

For standard (s) anthracene in ethanol the following values were determined:

 $n_s = 1.36$  (for ethanol);  $F_s = 54369.64173$ ;  $A_s = 0.315$ ;  $\phi_s = 0.28$ .

Here for **PTC**:

 $n_x = 1.36$  (for ethanol);  $F_x =$  (area under the curve considering the region 360 nm-600 nm)12934.16422,  $A_x = 1.06$ .

 $\phi_x(PTC) = 0.0197.$ 

For, **PTC**-Sn<sup>4+</sup>:

 $n_x = 1.3617$ (for ethanol);  $F_x =$  (area under the curve considering the region 360 nm-600 nm) 22752.72347,  $A_x = 0.64$ ;

 $\phi_x(PTC-Sn^{4+})=0.0577.$ 

Increase: 0.0577/0.0197= 2.93 fold of fluorescence quantum yield.
