## 1. Experimental Section

General considerations: All Reagents and solvents were purchased from commercial suppliers and used without further purification. 1,1'-bi-8-naphthol (2) ${ }^{[1]}$ and 2,2'-Dihydroxy-o-terphenyl (8) ${ }^{[2]}$ were synthesized according to literature procedures. Reactions were carried out under argon atmosphere in dry solvents and monitored in situ by thin-layer chromatography (TLC) carried out on silica gel plates (Merck KGaA; $60 \mathrm{~F}_{154}$ ), using UV light at 254 nm as the visualizing agent to assure consumption of starting materials prior to work up. Melting points were determined with melting point system Mettler Toledo MP90 and are uncorrected. NMR spectra were recorded on Bruker Avance II spectrometer $\left({ }^{1} \mathrm{H}: 500 \mathrm{MHz}\right.$, ${ }^{13} \mathrm{C}: 126 \mathrm{MHz}$ ) at room temperature. Chemical shifts are reported in parts per million ( ppm ) calibrated using residual non deuterated solvent as internal reference $\left(\mathrm{CDCl}_{3}\right.$ at $\delta 7.26 \mathrm{ppm}\left({ }^{1} \mathrm{H}\right.$ NMR $) \& \delta 77.16 \mathrm{ppm}\left({ }^{13} \mathrm{C}\right.$ NMR), TCE- $\mathrm{d}_{2}$ at $\delta 6.0 \mathrm{ppm}$ $\left({ }^{1} \mathrm{H}\right.$ NMR $) \& \delta 73.78 \mathrm{ppm}\left({ }^{13} \mathrm{C}\right.$ NMR $)$, DMSO- $\mathrm{d}_{6} \delta 2.50 \mathrm{ppm}\left({ }^{1} \mathrm{H}\right.$ NMR) $\& \delta 39.52 \mathrm{ppm}\left({ }^{13} \mathrm{C}\right.$ NMR)). Integration is determined as the relative number of atoms. APCI mass spectra were recorded on Agilent 6130 and Bruker Esquire 3000 mass spectrometers. High resolution mass spectrometry was performed on Thermo Fisher Scientific LTQ-XL-Orbitrap. The absorption and emission spectra were recorded using Perkin Elmer Lambda 9, Lambda 850 and Hitachi F-4500 spectrometer respectively. Absolute quantum yields were determined by Hamamatsu Photonic Multi-Channel Analyzer C10027 calibrated integrating sphere system. All spectra were measured at $22^{\circ} \mathrm{C}$ in toluene without degassing (concentration: $10^{-4}-10^{-5} \mathrm{M}$ ).

Dinaphth[1,8-bc: $\mathbf{1}^{\prime}, \mathbf{8}^{\prime}$-ef]oxepin (3): 1,1'-Bi-8-naphthol (2) ( $24.4 \mathrm{~g} ; 85 \mathrm{mmol}$ ) and $p$-TsOH ( $17.8 \mathrm{~g} ; 93.7 \mathrm{mmol} ; 110 \mathrm{~mol} \%$ ) in toluene ( 500 mL ) were refluxed for 3 h . After cooling to room temperature the solution was quenched with saturated $\mathrm{K}_{2} \mathrm{CO}_{3}$-solution. The organic phase was separated, washed with water and dried over $\mathrm{MgSO}_{4}$, filtered and concentrated under reduced pressure. The resulting dark yellow solid was recrystallized from heptane to yield $19.8 \mathrm{~g}(87 \%, 73.8 \mathrm{mmol})$ of $\mathbf{3}$ as dark yellow crystals. ## Cyclic Voltammetry

Cyclic voltammetry was performed on a Metrohm $\mu$ AUTOLABIII in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (oxidation) and THF solutions (reduction) of tetra- $n$-butylammonium hexafluorophosphate $(0.11 \mathrm{M})$ under argon atmosphere at a scan speed of $0.5 \mathrm{~V} / \mathrm{s}$. A gold electrode was used as a working electrode and a platinum-wire as the counter-electrode. $\mathrm{An} \mathrm{Ag} / \mathrm{AgCl} 3 \mathrm{M} \mathrm{KCl} / 0.025 \mathrm{M}$ TMACl (in ethylene glycol) electrode was used as the reference electrode for reduction scans and an $\mathrm{Ag} / \mathrm{AgCl} 3 \mathrm{M}$ $\mathrm{KCl} / 0.4 \mathrm{M} \mathrm{TEABr}$ (in ethylene glycol) electrode for oxidation scans. The CV curves were calibrated using the ferrocene/ferrocenium $\left(\mathrm{Fc} / \mathrm{Fc}^{+}\right)$redox couple as an internal standard. HOMO and LUMO energy levels were estimated from the equations

$$
\begin{gathered}
E_{\text {Номо }}=-\left(4.8+{ }^{o x} E_{1 / 2}-{ }^{F c / F c+} E_{1 / 2}\right) \\
E_{\text {LUMO }}=-\left(4.8+{ }^{\text {Red }} E_{1 / 2}-F c / F c+E_{1 / 2}\right),
\end{gathered}
$$

assuming the absolute energy of $\mathrm{Fc} / \mathrm{Fc}^{+}$to $4.8 \mathrm{eV}^{[3]}$ below the vacuum level. The half-wave potentials for the $\mathrm{Fc} / \mathrm{Fc}^{+}-$couple $\left({ }^{\mathrm{FcFcc}} \mathrm{E}_{1 / 2}\right)$, the oxidation $\left({ }^{\mathrm{O}} \mathrm{E}_{1 / 2}\right)$ and the reduction $\left({ }^{\mathrm{Red}} \mathrm{E}_{1 / 2}\right)$ were estimated from the average of anodic and cathodic peak potentials.
