As shown in Figure S1, pH increased slowly and then increased quickly with the addition of NaOH solution. pAAPBA moieties ionized gradually as the pH increased, and when pH is above 7.5, pAAPBA segments ionized mostly completely, and the pH increased rapidly in the range from 7.5 to 8.4 with the increasing amount of NaOH added in the solution. Additionally, when in acidic pH, the micelles were inclined to aggregation and precipitation was observed at pH 6.0, so the acidic pH was not considered in the measurement.

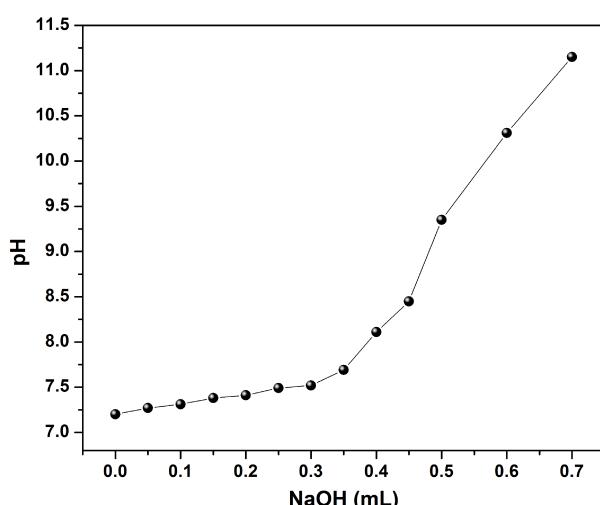

Figure S1. The pH as a function of the volume of NaOH (0.05 mol/L) added in 5 mL p(AAPBA4-*b*-GAMA1) micelles solution at 25 °C, where micelle solution had initial polymer concentration of 0.60 mg/mL.
