## Analytics

ICP and chromate analytics was performed by the DTNW Öffentliche Prüfstelle GmbH, a DAkkS and Oeko-Tex Standard 100/200 certified lab. Chromate measurement were performed in accordance with DIN EN ISO 11885. The limit of detection is  $40 \mu\text{g L}^{-1}$ , with a reproducibility of  $\pm 3 \%$ .

Kjeldahl analytics: The limit of detection is  $10 \mu\text{mol g}^{-1}$  with a reproducibility of  $\pm 5 \%$  for standard samples. In case of an textile the reproducibility is  $\pm 15 \%$ .

## SEM Images

## Analysis of real-life ground-water samples

Table S1. Real-life ground water samples, results of pH, TOC, TN<sub>b</sub> and ICP analysis

Blind		Breakthrough measurement run#			
		1	1	2	2
Parameter	[mg L <sup>-1</sup> ]	10 min	55 min	10 min	45 min
		[mg L <sup>-1</sup> ]	[mg L <sup>-1</sup> ]	[mg L <sup>-1</sup> ]	[mg L <sup>-1</sup> ]
Cr	56.613	0.033	1.130	0.026	10.701
Ca	61.20	60.921	61.820	60.710	60.903
Mg	161.90	2.535	6.184	1.083	6.217
Mn	0.35	0.143	0.355	0.008	0.237
Cu	0.19	0.121	0.154	0.130	0.170
Fe	1.12	0.912	0.984	1.031	1.080
TOC	95.4 ± 5.9	98.7	92.5	92.3	97.1
TN <sub>b</sub>	4.33 ± 0.5	4.53	4.03	3.98	4.71
pH	7.7	-	-	-	-

Table S2. Chromate concentration after 10 min and after breakthrough

Run	10 min	Breakthrough
	[mg L <sup>-1</sup> ]	[mg L <sup>-1</sup> ]
1	0,033	1,133
2	0,026	10,702
3	0,020	9,182
4	0,047	11,400
5	1,28*	13,403
6	0,050	3,601
7	0,044	4,310
8	0,025	1,871

\*Sample take at 17 min.

## Breakthrough Measurement

## PVAm leaching

Two different methods were used one to prevent leaching and the other to measure leaching during application. Leaching was prevented by the extraction, the samples were extracted until a constant weight was reached. Typically this was achieved after 8 h, as safety margin the triple extraction time (24 h) was chosen (2.1). Furthermore three samples finished with PVAm at pH 11 of  $10 \times 10 \text{ cm} \approx 1 \text{ g}$  were extracted in a Soxhlet-extractor with water for five days to investigate, if a long time exposure to hot water, reduces the amount of bound PVAm. No change of the weight was observed within an uncertainty of  $\pm 2.5 \%$  and no change of the nitrogen content was observed, within the standard deviation reported in Table 1. Leaching during application was measured in the breakthrough experiments, after 10 minutes and after the breakthrough was reached. The change of the Total Organic Carbon (TOC) and Total Nitrogen ( $\text{TN}_b$ ) was measured with a Hach-Lange TOC cuvette test LCK 386 ( $30\text{-}300 \text{ mg L}^{-1}$ ,  $< 10 \%$ ) and  $\text{TN}_b$  by Hach-Lange LATON cuvette test LCK 138 ( $1\text{-}16 \text{ mg L}^{-1}$ ,  $\pm 5 \%$ ). No change of TOC/ $\text{TN}_b$  was observed. All measurements were done as a triple determination.
