

## Supporting Information

### Sulfur Quantum Dots Wrapped by Conductive Polymer Shell with Internal Void Spaces for High-Performance Lithium-Sulfur Batteries

Fig. S1. SEM images of S treated with CS<sub>2</sub>. Elemental sulfur was directly dissolved in CS<sub>2</sub> and magnetic stirred at 40 °C, plenty of nanopores and nanoparticles (b) formed and precipitated on the surface of large sulfur particles (a) as the CS<sub>2</sub> solvent vaped out.

Fig. S2. TEM images of the S/PVK composites.

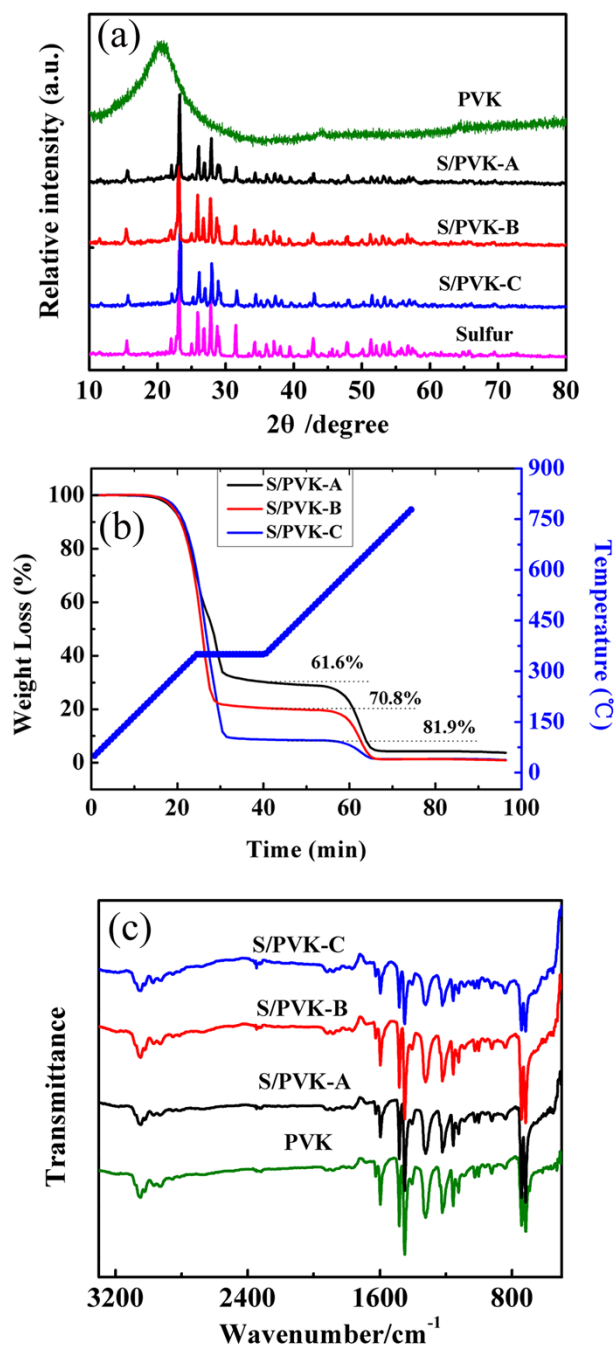

Fig. S3. (a) XRD patterns of S/PVK nanocomposites with different S content. (b) Thermal gravimetric analysis (TGA) of S/PVK nanocomposites. (c) FT-IR spectra of S/PVK-A, B and C. The TGA measurements of S/PVK and SQD/PVK composites were measured in a two-stage heating procedure under nitrogen flow which were first heated in the range of 50-350 °C at a heating rate of 10 °C/min, and then maintained at this temperature for 20 minutes before heating to 800 °C with the same heating rate. TGA measurement of pure PVK was measured from 50-800°C at a heating rate of 10 °C/min.

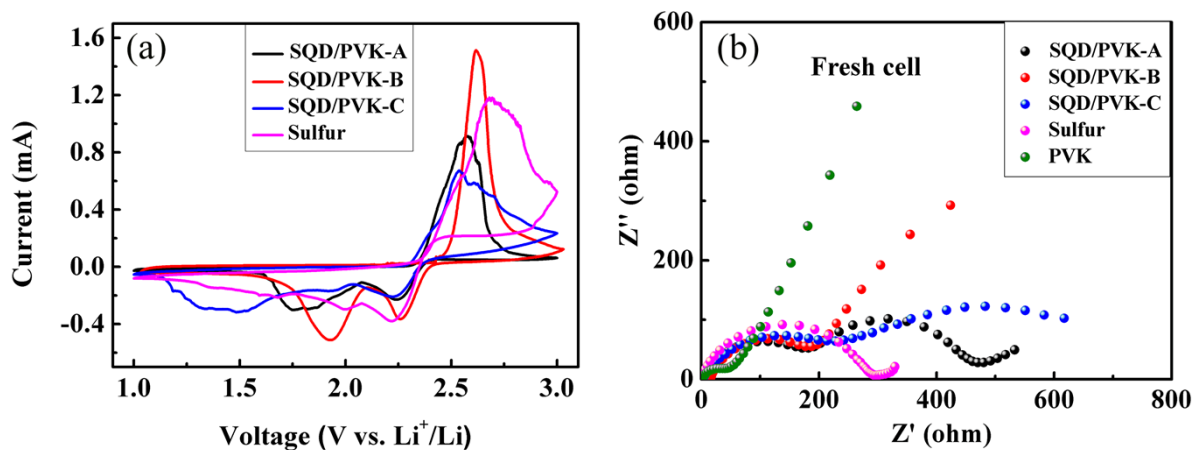

Fig. S4. (a) Cyclic voltammograms of sulfur and the SQD/PVK composite electrode at  $0.05 \text{ mV s}^{-1}$  at 1.0 to 3.0 V vs.  $\text{Li}/\text{Li}^+$ . (b) Nyquist plots of the electrode for the different SQD/PVK nanocomposites, pure PVK and pure sulfur cathode before cycling from 200 kHz to 100 mHz at room temperature.

*Table S1 A Comparison of the Electrochemical Performance of Conducting Polymer/S Composites from Literatures*

sample	sulfur content (wt%)	cycling performance				Ref.
		current	reversible DC	cycles	capacity retention	
<sup>b</sup> PANI/S	62	1 C	432	500	76%	22
<sup>c</sup> PTh/S	71.9	0.0625 C	830.2	80	74.2%	21
<sup>d</sup> PPy/S	77	0.5 C	726	500	60%	24
<sup>e</sup> PEDOT/S	72	0.25 C	930	50	83%	25
PANI/S	82	0.5 C	628	200	68.3%	23
<sup>f</sup> PEDOT: PSS/S	unknown	0.2 C	600	150	52.6%	33
<b>S/PVK</b>	<b>70.8</b>	<b>0.5 C</b>	<b>687.7</b>	<b>200</b>	<b>89.7%</b>	<b>this work</b>
		<b>0.5 C</b>	<b>488.6</b>	<b>600</b>	<b>63.8%</b>	<b>this work</b>
		<b>0.75 C</b>	<b>656.5</b>	<b>80</b>	<b>92.1%</b>	<b>this work</b>
		<b>0.75 C</b>	<b>608.4</b>	<b>150</b>	<b>85.4%</b>	<b>this work</b>

1 C=1672~1680 mA g<sup>-1</sup>, DC<sup>a</sup> is the discharge specific capacity/mAh g<sup>-1</sup>, <sup>b</sup>PANI is the abbreviation of polyaniline, <sup>c</sup>PTh is polythiophene, <sup>d</sup>PPy is polypyrrole, <sup>e</sup>PEDOT is poly(3,4-ethylenedioxythiophene), and <sup>f</sup>PEDOT:PSS is poly(3,4-ethylenedioxythiophene)-poly(styrene sulfonate)

Figure S5. (a) CV curves of the pure PVK electrode at a scan rate of  $0.05 \text{ mV s}^{-1}$ . (b) Cycling performance of pure PVK electrode at a current density of  $20 \text{ mA g}^{-1}$ .

Figure S6. SEM images of the SQD/PVK-B electrode before cycling (a and b), and after 500 cycles (c and d).
